

Hydropower is...

Clean

Our power plants emit none of the waste gases that cause acid rain, air pollution or global warming. They are very quiet and require no outside fossil fuel.

Reliable

Our slow, mechanically simple hydropower units are reliable and durable.

Efficient

Our plants convert about 90% of the available water energy into electricity. Fossil fuel plants are only about 50% to 60% efficient.

Renewable

The sun, rain and snow provide the power for our generators using the hydrologic cycle.

Flexible

We can readily start and stop our units to meet demand.
