Executive Summary

ES.1 Project Introduction

This Data Gap Investigation (DGI) Technical Memorandum has been prepared by Shaw Environmental & Infrastructure, Inc. (Shaw) for the former Guterl Specialty Steel Corporation Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Guterl Steel Site) in Lockport, New York.

The purposes of this investigation were to:

- Provide the additional data needed to assess the extent of impact to groundwater at the Guterl Steel Site by uranium.
- Further delineate the Guterl Steel Site conditions which control the mobility and fate and transport of the contaminants in groundwater.

ES.2 Project Scope

The following tasks were performed as part of the DGI:

Monitoring Well Installation

To delineate the vertical and horizontal extent of groundwater contamination and to characterize bedrock and hydrogeologic conditions at the Guterl Steel Site, 12 deep bedrock wells and 5 additional shallow wells were installed. Continuous overburden sampling and bedrock coring were performed for each monitoring well location.

Aquifer Testing

Aquifer testing for hydraulic conductivity was conducted at each of the 17 newly installed monitoring wells. Depending upon the hydraulic conditions encountered, either a set of manual falling and rising head tests or a pneumatic rising head test were performed.

Spring/Summer 2011 Groundwater Sampling and Analysis

A total of 51 wells and 2 seep locations were sampled. Laboratory analysis of groundwater samples from 51 monitoring wells and 2 seep locations was conducted for the following parameters:

- Total uranium – filtered and unfiltered
- Isotopic uranium – filtered and unfiltered
- Target Analyte List (metals) – filtered and unfiltered

- Anions (chloride, fluoride, sulfate, nitrate, nitrite, and ortho-phosphate) – unfiltered
- General chemistry (alkalinity, total dissolved solids) – unfiltered

Laboratory analysis of unfiltered groundwater samples from 35 locations was conducted for volatile organic compounds (VOCs). These locations included 16 existing wells that have historical VOC impacts, all 17 newly installed wells, and the 2 seep locations.

Radiological groundwater data validation was performed by a third party validator, Kestrel Environmental Technologies, Inc.

City of Lockport Sewer Sampling and Analysis

Off-site sewer samples were collected from the City of Lockport industrial sewer line downgradient of the site as follows:

- One sludge/sediment sample and one wastewater sample were collected from two sanitary sewer manholes.
- Each sludge/sediment and wastewater sample was analyzed for isotopic uranium (U) and isotopic thorium (Th).

Disposal of Investigation Derived Waste Generated During Current Field Investigation

Investigation Derived Waste (IDW) generated during the field investigation consisted of solids (e.g., soil drill cuttings) and liquids (e.g., water from decontamination, well development, and well purging operations). The IDW was sampled and analyzed, then transported to a properly licensed facility for disposal (U.S. Ecology Texas, Inc.).

ES.3 Geology, Hydrogeology, and Analytical Results

This section provides a discussion of the results of the DGI, including geology, hydrogeology, the extent of contamination, and a geochemical evaluation.

Site Geology

Unconsolidated materials overlying the bedrock surface at the Guterl Steel Site have been characterized as relatively thin to discontinuous layers of glaciolacustrine deposits, glacial till, and fill material (overburden soil). Native soils consist of silts and clays with varying amounts of sand and bedrock fragments. The fill material, where encountered, has been described as coal fragments, apparent ash and coke fragments, and brick or crushed stone. The overburden thickness in borings completed in 2011 ranged from 1.7 to 7.6 feet (ft). For discussion purposes in this document, these unconsolidated materials will be named the overburden soil.

Bedrock underlying the overburden soil at the Guterl Steel Site was described as medium gray to light gray dolomite. The upper part of the dolomite, identified as shallow weathered bedrock in this document was observed to contain numerous horizontal fractures. Vertical and angled

fractures with much less frequency were also identified. Many of the fractures were noted to be weathered and/or clay filled. The lower portion of the bedrock, starting at depths of 20 to 25 ft below the overburden and shallow weathered bedrock interface, is not weathered and has distinct fractures; however, the fracture density is lower than that in the shallow weathered bedrock and decreases with depth. This zone is called the first main fracture zone, and extends to a depth of approximately 40 ft below the bottom of the shallow weathered bedrock. The first main fracture zone is underlain by shaly dolostone, and is estimated to be 20 to 30 ft thick with few to no fractures. The shaly dolostone in turn is underlain by Rochester Shale.

The stratigraphic order at the site, starting from ground surface is summarized follows:

- Overburden soil
- Shallow weathered bedrock (shallow groundwater)
- First main fracture zone (deep groundwater)
- Shaly dolostone (no monitoring wells installed)
- Rochester Shale (no monitoring wells installed)

Site Hydrogeology

Depths to water in the shallow bedrock wells during the August 2011 gauging event ranged from 3 ft below ground surface (bgs) to 10.5 ft bgs. The shallow groundwater wells are installed in the shallow weathered bedrock. Water levels in the deep bedrock wells are more variable than in the shallow bedrock and range from 3.3 ft bgs to 35.4 ft bgs. Deep groundwater wells are installed in the first main fracture zone. Monitoring wells have not been installed in the underlying shaly dolostone or Rochester Shale.

Groundwater Flow

A groundwater divide oriented northwest to southeast originates in the northwestern area of the Guterl Steel Site. West of the divide, the groundwater flow direction is towards the quarry. South and east of the divide, groundwater flow is to the southeast towards the canal.

Hydraulic Conductivity

Results of slug tests conducted on the newly installed monitoring wells in August 2011 were reduced to obtain horizontal hydraulic conductivity values for each of the tested wells. Hydraulic conductivity values obtained for the shallow bedrock wells range from 0.024 ft/day at MW-705D to 218 ft/day at MW-3. Hydraulic conductivity values obtained for the deep bedrock wells range from 0.0009 ft/day at MW-711DD to 41.4 ft/day at MW-712DD.

Extent of Contamination

The highest uranium concentration (209 micrograms per liter [µg/L] with a concentration of 212 µg/L in the duplicate sample) detected in groundwater was in the shallow bedrock well located near the center of the Guterl Steel Site. Concentrations greater than 90 µg/L were detected north of Buildings 14 and 37 and appear to trend in a northwest to southeast direction

across the Guterl Steel Site towards the canal. A concentration of 44.9 µg/L was detected at the furthest existing downgradient sampling point (Seep 01 on the wall of the Erie Canal) characterized to be a potential discharge point for shallow groundwater. The distribution of uranium in deep groundwater appears in a similar orientation as the shallow groundwater; however, the plume is much smaller. The highest concentration (67 µg/L) detected in a deep well came from a location near the southeastern Guterl Steel Site boundary.

Uranium Geochemistry

Uranium concentrations in the 57 filtered groundwater samples (including duplicates) were determined by Inductively Coupled Plasma/Mass Spectrometer (ICP/MS) method. These samples were also analyzed for uranium via alpha spectroscopy, which determines the individual activities of the ^{234}U, ^{235}U, and ^{238}U isotopes. Comparison of uranium concentrations by the two different analytical methods indicates close agreement and a lack of bias in either method.

The isotopic uranium results indicate that only natural uranium was present in the samples (depleted, enriched, or recycled uranium was not identified in the samples).

Uranium detected in the 2011 samples was predominantly present in a dissolved state.

The mobility of uranium in groundwater is the most sensitive to oxidation reduction (redox) conditions, being very low under reducing conditions, and is much higher under oxidizing conditions. Although moderately reducing conditions exist at some locations, the uranium is predicted to be in the soluble hexavalent form at all of the sampled locations. Uranium mobility is therefore not limited by precipitation, but will be controlled by sorption along groundwater flow paths.

Sanitary Sewer Sampling Results

At the request of the City of Lockport, solid and liquid samples were collected from two sanitary sewer locations. These data were requested by the City to assess municipal worker safety.

The sample from Sewer #1 was collected from the accessible manhole closest to the facility. The sample from Sewer #2 was collected from the next accessible manhole downstream. The results for the two solid samples, Sewer #1 and Sewer #2, respectively, are 0.27 and 0.47 picoCuries per gram (pCi/g) for ^{228}Th; 0.45 and 0.32 pCi/g for ^{230}Th; 0.22 and 0.44 pCi/g for ^{232}Th; 3.55 and 4.37 pCi/g for ^{234}U; 0.2 and 0.22 pCi/g for ^{235}U; and 3.72 and 4.77 pCi/g for ^{238}U.

The results for the two liquid samples, Sewer #1 and Sewer #2, respectively, are 10.9 and 0.43 pCi/L for ^{234}U; 0.61 and 0.04 pCi/L for ^{235}U; and 10.4 and 0.44 pCi/L for ^{238}U. The isotope ^{230}Th was detected in one sample, Sewer #1, at 0.03 pCi/L. The remaining thorium isotopes were not detected.

ES.4 Conclusions

Based on the results of the DGI, the following conclusions are drawn:

- Total uranium is present at concentrations exceeding the background concentration of 10 µg/L in the deep groundwater which flows through the first main fracture zone of the competent dolostone, located between 30 and 40 ft deep, and corresponds with the screened locations of the deep monitoring wells.
- The horizontal extent of groundwater with total uranium concentrations exceeding background covers approximately one third of the area in the first main fracture zone (deep groundwater) compared to the shallow weathered bedrock (shallow groundwater). The areas exceeding background are primarily near the buildings in both zones.
- Groundwater with uranium concentrations exceeding background is discharging to the Erie Canal at the location of Seep 01.
- Hydraulic conductivity values are generally lower in the first main fracture zone (deep groundwater) than in the shallow weathered bedrock (shallow groundwater). Average and median values for hydraulic conductivity in the shallow weathered bedrock are 27.8 ft/day and 11.9 ft/day, respectively. Average and median values for hydraulic conductivity in the first main fracture zone (deep bedrock) are 7.5 ft/day and 3.2 ft/day, respectively. The geometric means of hydraulic conductivity values in the shallow weathered bedrock and the first main fracture zone are 10 ft/day and 1 ft/day, respectively.
- The difference in hydraulic conductivities between the shallow weathered bedrock and the first main fracture zone was reflected in the production rates measured in monitoring wells during well development and sampling, and response times to slugs during slug testing, therefore confirming the interpretation of slug test data.
- Geotechnical test data indicate that partition coefficient (Kd) values ranged from 1,052 milliliter per gram (mL/g) to 95,667 mL/g, with an average value of 17,699 mL/g and a geometric mean value of 5,722 mL/g. The Kd values reported in this report were derived from soil samples that were collected in unsaturated soil overlying the shallow groundwater present in the shallow weathered bedrock. These Kd values represent the potential for the infiltrating rainwater to desorb uranium from the unsaturated soil and leach into the underlying groundwater. The soil samples used for the Kd analysis were collected from areas where the soil uranium concentrations were less than the source area soils and, therefore, may not directly indicate the desorption potential for uranium in the source areas.

- These values indicate that total uranium will preferentially remain bound to soil instead of desorbing to recharge water and leaching to groundwater.
- Groundwater flow directions in the first main fracture zone (deep groundwater) are generally consistent with groundwater flow in the shallow weathered bedrock (shallow groundwater). Groundwater flow in both zones is generally to the south, but to the southeast toward the Erie Canal on the eastern part of the site and to the southwest toward the quarry on the western part of the site.
- The uranium isotope ratios are consistent with naturally occurring uranium (^{234}U and ^{238}U are present at equal concentrations by activity), indicating the uranium processed at the site was neither enriched nor depleted.
- Comparison of filtered and unfiltered total uranium results indicates most of the uranium present is dissolved. Approximately 98 percent of the total uranium was in the dissolved form in the samples collected.
- Geochemical conditions in the aquifer indicate total uranium will remain in a soluble form at all locations investigated. Redox conditions do not favor uranium precipitation.

The horizontal and vertical extent of uranium exceeding background has not been completely defined. Vertically, the DGI results determined that uranium impacted groundwater occurs in the deep groundwater flowing through the first main fracture zone of the competent dolostone that underlies the shallow weathered bedrock (shallow groundwater), where uranium contaminated groundwater was documented to be present during the remedial investigation (RI). There is another 40 to 45 ft of dolostone and shaly dolostone between the bottom of first main fracture zone of the competent dolostone and the Rochester Shale where the presence or absence of uranium impacted groundwater has not been determined.

Groundwater flow was observed to discharge at two locations along the northern rock face of the Erie Canal. This discharge represents a fraction of the groundwater flow that exits in the shallow and the deep groundwater units underneath the site. Data collected during the DGI has not established the flow path where the remainder of the groundwater exits; potential routes include discharge to the quarry, flow underneath the Erie Canal, and flow to the regional groundwater system through fractures in the dolostone and shaly dolostone that underlie the first main fracture zone of the competent dolostone.

The DGI results provide data on deep groundwater flow in the first main fracture zone of the competent dolostone, hydraulic conductivity and geotechnical data, nature and extent of total uranium shallow and deep groundwater plumes in the shallow weathered bedrock and the in the first main fracture zone of the competent dolostone, lithological characteristic of the rock units, and information on the locations of water producing fractures. Although there are gaps in data on horizontal and vertical characterization, the additional data collected during this investigation

is sufficient to develop a numerical groundwater model for the site that will allow evaluation of groundwater flow and transport.

1.0 Project Introduction

This Data Gap Investigation (DGI) Technical Memorandum has been prepared by Shaw Environmental & Infrastructure, Inc. (Shaw) for the former Guterl Specialty Steel Corporation Formerly Utilized Sites Remedial Action Program (FUSRAP) Site (Guterl Steel Site) in Lockport, New York (Figure 1-1).

1.1 Purpose and Scope

In accordance with the United States Army Corps of Engineers (USACE), Buffalo District Contract Number W912QR-08-D-0013, Delivery Order No. DN03, Shaw has prepared this DGI Technical Memorandum to document the collection of additional data to be used in the preparation of the Feasibility Study (FS) for the Guterl Steel Site, previously known as the Simonds Saw and Steel Company (Simonds).

The focus of this DGI Technical Memorandum is on the information needed to support the selection of a remedial action for impacted media at the Guterl Steel Site, in accordance with the USACE, Buffalo District, *Scope of Work, Data Gap Investigation to Support the Feasibility Study for the Former Guterl Specialty Steel Corporation, Lockport, New York*, dated March 2011.

Specifically, the purposes of this investigation were to:

- Provide the additional data needed to assess the extent of impact to groundwater at the Guterl Steel Site by uranium.
- Further delineate the Guterl Steel Site conditions that control the mobility and fate and transport of the contaminants in groundwater.

The following tasks are addressed in this DGI Technical Memorandum:

Task 8.2 Monitoring Well Installation

Task 8.3 Aquifer Testing

Task 8.4 Spring/Summer 2011 Groundwater Sampling and Analysis

Task 8.5 City of Lockport Sewer Sampling and Analysis

Task 8.6 Disposal of Investigation Derived Waste (IDW) Generated During Current Field Investigation

1.2 Project Specific Data Quality Objectives

The overall objective of the DGI was to address those data gaps identified by the previously performed Data Gap Analysis. This objective was accomplished through the collection of additional data that will be used in the preparation of the FS and a groundwater model for the

Guterl Steel Site. To achieve this general objective, nine specific data quality objectives (DQOs) were developed to guide the collection of data.

- DQO 1 – Identify the horizontal and vertical extent of uranium in groundwater and determine if these levels meet Applicable or Relevant and Appropriate Requirements.
- DQO 2 – Determine if hydrologic controls on the migration of uranium in groundwater, including impacts from local pumping, have been identified to a sufficient level to support the construction of a three-dimensional groundwater model.
- DQO 3 – Determine if geochemical controls on the migration of uranium in groundwater have been identified to a sufficient level to support the construction of a three-dimensional groundwater model.
- DQO 4 – Determine if the volatile organic compounds (VOCs) that have impacted groundwater may be affecting the mobility of uranium.
- DQO 5 – Determine if uranium-impacted groundwater is seeping into the Erie Canal.
- DQO 6 – Determine the horizontal and vertical variation in the hydraulic conductivity of the water bearing units to support the development of the three-dimensional groundwater model.
- DQO 7 – Determine the vertical hydrogeologic boundary for groundwater flow and migration of uranium-impacted groundwater.
- DQO 8 – Determine the effects of seasonal changes in groundwater levels on the mobility of uranium in groundwater.

1.3 Field Project Personnel/Organization

Staff responsibilities were generally consistent with those provided in Section 2 of the Addendum to the Field Sampling Plan (FSP) (USACE, 2011a) and the Remedial Investigation (RI) FSP (2007) (USACE, 2007). Mr. Kevin Cronin served as the Site Supervisor and Mr. Trenton Richards served as the Radiation Control Technician. Mr. Cronin and Mr. Richards are geologists and Site Safety and Health Officer trained.

1.4 Report Organization

The following sections are provided in this DGI Technical Memorandum:

Section 1.0 Project Introduction

Section 2.0 Project Scope

Section 3.0 Field Procedures

Section 4.0 Results

Section 5.0 Revised Conceptual Site Model

Section 6.0 Conclusions

Section 7.0 References

In addition, the findings in this document are supported by information in the following appendices:

Appendix K Historical Documents

Appendix L Evaluation of Unranium Concentration Trends

2.0 Project Scope

The following sections identify the tasks performed during the summer and fall of 2011 for this DGI Technical Memorandum. Work was performed at the Guterl Steel Site in accordance with the accepted Health and Safety Plan (HASP) and the task-specific Radiological Protection Plan (RPP) included in that HASP. The RPP was developed in accordance with USACE Engineer Manual (EM) 385-1-1 and 10CFR20, and previous survey and chemical and radiological sampling results from those locations on site. Chemical and radiological action levels were identified and instrumentation selected to adequately monitor the worksite with respect to these action levels during task activities. Project staff was briefed to the project requirements and a qualified Radiological Control Technician performed ongoing chemical and radiological monitoring. The results were reviewed daily by the project Certified Health Physicist. No results above the action levels were detected during the execution of the task. Thus, no increase in health and safety or radiological controls was warranted during completion of the task. Daily Reports and Field Notes are presented in Appendix A and photographs are in Appendix B.

2.1 Task 8.2 – Monitoring Well Installation

To delineate the vertical and horizontal extent of groundwater contamination, and to characterize bedrock and hydrogeologic conditions at the Guterl Steel Site, 12 deep monitoring wells and 5 shallow wells were installed at the locations shown on Figure 2-1. Well identification was consistent with previous investigations (USACE, 2007). Shallow bedrock wells correspond to the "D" wells (top of bedrock) installed during the RI. The deep bedrock wells were designated as "DD". The post-RI wells were designated as the 700-series.

Eight of the deep bedrock wells were installed at locations that coincide with existing shallow weathered/fractured bedrock wells MW-2, MW-13D, MW-19, MW-26, MW-602D, MW-604D, MW-605D, and MW-607D. At two of the deep bedrock well locations, next to existing wells MW-13S/D and MW-604D, the borings for the wells were drilled to the top of the Rochester Shale to define the lithology and fracture zones beneath the Guterl Steel Site. In addition to these eight deep bedrock wells, five additional pairs of shallow and deep bedrock monitoring wells were originally planned (MW-705D/MW-705DD, MW-710D/DD, MW-711D/DD, MW-712D/DD, and MW-713D/DD). However, several of the downgradient locations were adjusted due to off-site property access problems. As a result, MW-713DD was not installed because of its proximity to MW-708DD. A total of 17 wells were installed. The boring logs are presented in Appendix C.

As described in Section 3, continuous overburden sampling and bedrock coring were performed for each monitoring well location. Unconsolidated overburden soil samples were collected at the eight new on-site deep bedrock well locations. Each sample was submitted for laboratory analysis for bulk density and the uranium partition coefficient (Kd). In addition, effective

porosity was calculated at each location. The monitoring wells were developed and surveyed for location and elevation. The well development records are presented in Appendix D.

2.2 Task 8.3 – Aquifer Testing

Aquifer testing (described in Section 3.6) for hydraulic conductivity was conducted at each of the 17 newly installed monitoring wells. Depending upon the hydraulic conditions encountered, either a set of manual falling and rising head tests or a pneumatic rising head test were performed. Manual falling head tests were only conducted if the well screens were fully submerged.

Pneumatic slug testing apparatus was used, provided that the conditions were appropriate for the use of the pneumatic slug test technique (e.g., the monitoring well screens were fully submerged and the pneumatic setup was able to sustain pressurization).

Time-drawdown data were collected using an automated data-logger and downloaded to an electronic file. The slug test data were analyzed to calculate the hydraulic conductivity at each monitoring well. The slug test data plots are presented in Appendix E.

2.3 Task 8.4 – Spring/Summer 2011 Groundwater Sampling and Analysis

A comprehensive round of groundwater samples was collected in August 2011, after the new monitoring wells were installed. A total of 51 wells (Figure 2-1) were sampled using the procedures described in Section 3.7. The sample collection logs are presented in Appendix F and the laboratory quality reports are presented in Appendix G. Activities included the following:

- Headspace readings from each well using a photoionization detector (PID) prior to sample collection.
- Field parameter measurements at each well, including temperature, pH, dissolved oxygen (DO), oxidation reduction potential (ORP), turbidity, and specific conductivity (Table 2-1).
- Low-flow sampling at each well.
- Laboratory analysis of groundwater samples from 51 monitoring wells and 2 seep locations for the following parameters:
  - Total uranium – filtered and unfiltered
  - Isotopic uranium – filtered and unfiltered
  - Target Analyte List (metals) – filtered and unfiltered
  - Anions (chloride, fluoride, sulfate, nitrate, nitrite, and ortho-phosphate) – unfiltered
  - General chemistry (alkalinity, total dissolved solids) – unfiltered.

- Laboratory analysis of groundwater samples from 35 locations for VOC-unfiltered. These locations included 16 existing wells that have historical VOC impacts, all 17 newly installed wells, and the 2 seep locations. The wells that were included for VOC analysis were selected in consultation with the USACE following installation of the new monitoring wells.
- Radiological groundwater data validation by a third party validator, Kestrel Environmental Technologies, Inc. The data validation reports are presented in Appendix H.

2.4 Seep Sampling

A reconnaissance survey was conducted on September 8, 2011 to document the locations of groundwater seeping into the Erie Canal, and to collect samples representing the discharge of site groundwater to the Erie Canal. The canal walls were visually inspected for evidence of seeping groundwater along an approximate 0.75-mile section of the Erie Canal, which was bounded by the Lockport Bypass located upstream of the Guterl Steel Site, and Stevens Street bridge located downstream of the site. No seeps were observed along the southern rock face of the Erie Canal, while seeps were observed at two locations along the northern rock face of the Erie Canal.

Seep samples were collected at Seep 01 and Seep 02 by the USACE (Figure 2-1) for the analysis of general chemistry parameters (unfiltered samples), total uranium (filtered and unfiltered samples), metals (filtered and unfiltered samples), and VOCs (unfiltered samples). Shaw provided sample bottles, sample filtration, and a Geologist for recording information needed for the FS such as stratigraphy, locations, and frequency of seeps. Seep 01 was located approximately 300 feet (ft) downstream of a pipeline crossing the Erie Canal, approximately 6 ft above the water surface in the Erie Canal, while Seep 02 was located approximately 150 ft downstream of the Lockport Bypass approximately 5 ft above the water surface in the Erie Canal. The water elevation in the Erie Canal was determined to be 565.7 ft above mean sea level (msl) by referencing to the gauge reading at Lock 35, approximately 1.75 miles downstream of the Guterl Steel Site. The elevations of the two seeps are higher than the elevation of the base of the shallow bedrock, indicating that groundwater from the shallow bedrock zone (fractured dolostone) may be discharging as seeps to the Erie Canal.

2.5 Task 8.5 – City of Lockport Sewer Sampling and Analysis

One sludge/sediment sample and one wastewater sample were collected from the two sanitary sewer manholes shown on Figure 2-2, City of Lockport Utility Sampling Locations. Turbidity measurements were collected and recorded during sample collection. Each sludge/sediment and wastewater sample was analyzed for isotopic uranium and isotopic thorium (Th).

2.6 Task 8.6 – Disposal of Investigation Derived Waste Generated During Current Field Investigation

IDW generated during the field investigation consisted of solids (e.g., soil drill cuttings) and liquids (e.g., water from decontamination, well development, and well purging operations). The IDW was sampled and analyzed, then transported to a properly licensed facility for disposal (U.S. Ecology Texas, Inc.). The bill of lading for the IDW is presented in Appendix I.

3.0 Field Procedures

Information presented in this section pertains to field activities conducted from June to September 2011. Field activities and analytical procedures were performed in accordance with the *Sampling and Analysis Plan Addendum* (USACE, 2011 a,b,c), which includes:

- Volume 1 – FSP
- Volume 2 – Quality Assurance Project Plan (QAPP)
- Volume 3 – Accident Prevention Plan

These documents incorporate applicable sections of the RI FSP (USACE, 2007). Field procedures are discussed in the following sections.

3.1 Utility Clearances

The newly installed monitoring wells are located both on and off site (Figure 2-1). All drilling locations were staked, and a site survey was performed to identify signs of buried or overhead utilities in the vicinity of the drilling locations. Prior to any subsurface investigation, public utilities (water, gas, electric, phone, etc.) were located and marked. The one-call Dig Safely New York Center was utilized to clear areas in public domain. In addition, the Site Manager for Allegheny Technologies Inc. (ATI) Allvac, Reg Buri, was consulted on the issue of underground utilities.

After all mark outs were completed, and the boring locations were accepted by the Field Geologist, each borehole location was cleaved with an air knife to a minimum of 5 ft below ground surface (bgs) prior to drilling.

3.2 Boring and Well Installation

Continuous overburden sampling and bedrock coring were performed for each monitoring well location. At two of the deep well locations, next to existing wells MW-13D and MW-604D, the borings for the wells were drilled to the top of the Rochester Shale to define the lithology and fracture zones beneath the Guterl Steel Site.

Boreholes were advanced through the overburden to the top of bedrock using 6-1/4-inch inside diameter (ID) hollow stem augers, producing a borehole of approximately 10 inches outside diameter. A permanent 4-inch ID steel casing was grouted into place and allowed to cure for a minimum of 24 hours. The bedrock borehole was then advanced using an HQ-wireline coring system producing a nominal 3-15/16-inch diameter open-bedrock borehole. As performed for prior investigations, 2-inch ID polyvinyl chloride (PVC) screen and riser monitoring wells were installed in the open-bedrock borehole and permanent casing.

Shallow bedrock wells were screened within the upper 10 ft of the shallow weathered bedrock to be consistent with existing monitoring wells installed during the 2004 New York State

Department of Environmental Conservation (NYSDEC) Immediate Investigative Work Assignment (IIWA), the 2006 NYSDEC RI/FS, and the USACE RI. Deep wells were installed in the first water-bearing unit in competent bedrock. Completed wells were surveyed for horizontal location and elevation by McIntosh & McIntosh, P.C. of Lockport, New York.

Protective covers were placed at each well. A flush-mount protective cover was used in some locations in place of the protective casing. Flush-mount wells were completed with at least an 8-inch diameter traffic rated vault.

3.3 Geotechnical Sample Collection

Unconsolidated overburden soil samples were collected for geotechnical analysis at eight deep bedrock well locations, which were all located within the property boundary. Samples were collected from the overburden soil at the following locations and depth intervals:

Boring	Overburden thickness (ft)	Sample depth (ft below ground surface [bgs])
701DD	7.6	5-7
702DD	4	2-4
703DD	2	0-2
704DD	4	0-2
706DD	6.5	4.5-6.5
707DD	3.4	0.5-2.5
708DD	1.8	0-2
709DD	2.4	0-2

Geotechnical samples were collected in an undisturbed state to the extent possible, using a 3-inch diameter split-spoon sampler with acetate liners. After the acetate tubes were removed from the split-spoon, the ends were capped, and orientation arrows were drawn. The measured sample lengths ranged from 5.8 inches to 16.4 inches, and the sample weights ranged from 0.46 Kilograms (Kg) to 1.9 Kg. Void spaces at the top and the bottom of the tubes were filled with inert material, and the ends of the tubes were sealed to prevent shifting and dehydration during shipment. No refrigeration or icing was required for the geotechnical soil samples. The geotechnical laboratory report is presented in Appendix J.

3.4 Monitoring Well Development

The development of monitoring wells was initiated no less than 48 hours after placement of the grout seal. Data were recorded on a Monitoring Well Development Record Form (Appendix D).

Well development was conducted by bailing or using a submersible pump and surge block to aid in the removal of sediment from the well and filter pack.

Development of each monitoring well proceeded until each of the following criteria was achieved:

- Water was clear to the unaided eye
- The sediment thickness remaining within the well was less than 0.1 ft
- A maximum of one 55-gallon drum of development water had been removed
- Equalization of required water quality parameters (for three consecutive readings at a frequency of one reading per well volume) was achieved for:
  - pH (variation ± 0.2 units)
  - DO (variation ± 10 percent)
  - Specific conductivity (variation ± 3 percent)
  - Temperature (variation ± 1 degree Centigrade)
  - Turbidity (variation ± 10 percent)
  - ORP (variation ± 10 millivolts)

3.5 Aquifer Tests

A slug test was performed at each of the 17 newly installed monitoring wells. Slug tests were conducted by instantaneously (or nearly instantaneously) changing the water level in each monitoring well by displacing a volume of water and then monitoring the water level recovery. Slug tests were performed during either falling or rising head within a monitoring well, and if applicable, during both falling and rising heads.

Manual or pneumatic slug tests were conducted at each location, depending upon the hydraulic conditions encountered. Pneumatic slug tests were performed because this test procedure provides more accurate results in highly transmissive formations. The following guidelines were used to determine the type of slug test performed:

- At monitoring wells where the screens were fully submerged in groundwater, a pneumatic slug testing apparatus was used, provided that the pneumatic setup was able to sustain pressurization. The pneumatic apparatus was used to depress the groundwater followed by the performance of a rising head slug test.
- At wells where the screens were fully submerged in groundwater, but the pneumatic slug testing apparatus was unable to sustain pressurization, the slug test was conducted by using a physical slug that was manually introduced and then removed from the monitoring well. A set of rising and falling head slug tests were conducted.

- At wells where the screens were partially submerged in groundwater, the slug test was conducted by using a physical slug that was manually removed from the monitoring well. Only a rising head slug test was conducted, since the falling head test is not accurate for situations where the screens are partially submerged in groundwater.

In addition to the FSP, the procedures outlined in American Society for Testing and Materials (ASTM) D 4044 - 96 (2008): *Standard Test Method for (Field Procedure) Instantaneous Change in Head (Slug) Tests for Determining Hydraulic Properties of Aquifers,* were used to perform the slug tests. For pneumatic slug tests, the procedures outlined in ASTM D 7242 - 06 (2006): *Standard Practice for Field Pneumatic Slug (Instantaneous Change in Head) Tests to Determine Hydraulic Properties of Aquifers with Direct Push Ground Water Samplers,* was followed. The Pneumatic Hi-K™ Slug Assembly manufactured by Midwest Geoscience Group was utilized for the performance of the pneumatic slug test. This assembly uses air pressure to lower the water level in the monitoring well and a valve to instantaneously release the pressure.

Time-drawdown data were collected using an automated data-logger contained within a pressure transducer that was installed in each monitoring well prior to the performance of the slug test. The data were downloaded to an electronic file for access and future use of data.

The slug test data were analyzed to calculate the hydraulic conductivity at each monitoring well. Analysis of the slug test was performed using procedures presented in Shaw Standard Operating Procedure EI-GS045 and ASTM D 5912 - 96 (2004): *Standard Test Method for (Analytical Procedure) Determining Hydraulic Conductivity of an Unconfined Aquifer by Overdamped Well Response to Instantaneous Change in Head (Slug)*. The software program AQTESOLV™, using input data from the data logger and well construction details from monitoring well diagrams, was used to analyze the test data.

3.6 Groundwater Sampling

One round of groundwater samples was collected during the DGI. Collection of groundwater samples from monitoring wells involved three general steps: (1) well purging, (2) measurement and stabilization of field parameters, and (3) groundwater sample collection. These are the three steps of sample collection that were consistently used at each well with adequate yield. However, at wells that purged dry, samples were collected after sufficient volume had recharged. Groundwater sampling activities followed the requirements of USACE EM 200-1-3 Engineering Design – Requirements for the Preparation of Sampling and Analysis Plans, Appendix C.2, Groundwater Sampling (USACE, 2001).

A headspace reading was collected from each well prior to sample collection. Purging of monitoring wells was accomplished using a peristaltic pump, a disposable bailer, or a low-flow submersible pump. The use of a peristaltic pump with dedicated Teflon® tubing left in the well was the preferred method (e.g., down-hole Teflon® line, flexible pump roller tube, and Teflon®

outflow tube). A bailer was used only if attempts to use a submersible pump were unsuccessful (that is, insufficient recharge).

In order to minimize the quantity of liquid IDW generated as a result of well purging, wells were micro-purged where conditions permitted, in accordance with EM 200-1-3 C.2 (USACE, 2001) as follows:

- A submersible pump or peristaltic pump was used for purging.
- Pump intake or tubing was located within the well screened interval.
- Purge rate did not exceed 100 milliliters per minute unless it was shown that higher rates would not disturb the stagnant water column above the well screen (that is, would not result in drawdown).
- Volume purged was based on the stabilization of the following required water quality parameters for three consecutive readings (measured at minimum five-minute intervals) for:
  - pH (variation ± 0.2 units)
  - DO (variation ± 10 percent)
  - Specific conductivity (variation ± 3 percent)
  - Temperature (variation ± 1 degree Centigrade)
  - Turbidity (variation ± 10 percent)
  - ORP (for data needs, not as a stabilization parameter).
- Sample collection occurred immediately after micro-purging.

Filtered and unfiltered groundwater samples were collected during the DGI. Filtered samples were collected using 0.45 micrometer (µm) disposable in-line pore filter attached to the discharge line of the pump. Filters were replaced between sample locations, and if needed, as they became restricted by solids buildup at any one location.

Unfiltered samples were collected for the following parameters:

- Anions (chloride, fluoride, sulfate, nitrate, nitrite, and ortho-phosphate)
- General chemistry (alkalinity, total dissolved solids)
- VOCs (select wells)

Filtered and unfiltered samples were collected for the following parameters:

- Total and isotopic analyses for uranium
- Target Analyte List (23 metals)

3.7 Seep Sample Collection

Seep samples were collected on August 8, 2011 using disposable sample containers provided by the laboratory. One round of samples was collected at two locations by placing a stainless steel container underneath the seep and letting the water accumulate until the desired volume was collected. The water was then transferred to the individual sample containers that were pre-filled with the required preservatives, after performing field filtration, if required for the parameter of interest.

Unfiltered samples were collected for the following parameters:

- Anions (chloride, fluoride, sulfate, nitrate, nitrite, and ortho-phosphate)
- General chemistry (alkalinity, total dissolved solids)
- VOCs

Filtered and unfiltered samples were collected for the following parameters:

- Total and isotopic analyses for uranium
- Target Analyte List (23 metals)

Filtered samples were collected using a 0.45 μm disposable in-line pore filter attached to the discharge line of a peristaltic pump. Filters were replaced between seep sample locations. The VOC samples were collected in triplicate. Chain-of-custody forms were completed, and samples were placed in coolers filled with ice prior to being shipped to the laboratory for analysis. With the exception of the filters, no wastes were generated during the sampling process.

3.8 Off-Site Sewer Sample Collection

Sewer samples were collected using a disposable sample container attached to an adjustable pole. A new container was used at each location to collect sludge/sediment and wastewater samples for analysis. The second sewer sample (Sewer 2) was collected from a location downstream from the location proposed in the DGI Work Plan (found to be under Ohio Street) that had been paved over with asphalt and could not be accessed. This second sample was collected from a manhole located in a grassy area adjacent to the Newfane Lumber Co. property, immediately east of the Guterl Steel Site. Sludge/sediment and wastewater samples were analyzed for total (unfiltered) isotopic uranium and isotopic thorium.

3.9 Analytical Program

Following collection, the samples were sent to Test America-St. Louis, in Earth City, Missouri. Courier and shipping services were provided by Test America-Buffalo, New York. Analytical methods were consistent with the methods provided in the QAPP (USACE, 2011b).

3.10 Investigation Derived Waste Disposition

A total of 15,600 pounds of non-hazardous IDW soils, and 9,200 pounds of non-hazardous IDW liquid wastes, were disposed at U.S. Ecology Texas, Inc., in Robstown, Texas. IDW sample results are presented in Tables 3-1 and 3-2.

4.0 Geology, Hydrogeology, and Analytical Results

This section provides a discussion of the results of the DGI, including the geology, hydrogeology, extent of contamination, and a geochemical evaluation.

4.1 Regional Geology and Hydrogeology

The Guterl Steel Site is located in the Erie-Ontario lowlands physiographic province. Unconsolidated glacial deposits of till and lacustrine clay, silt, and sand overlie gently dipping sedimentary rocks throughout the area. The bedrock of this region is predominantly limestone, dolostone, and shale. Middle Silurian epoch dolomite and limestone formations of the Lockport Group directly underlie the glacial sediments in the area of the Guterl Steel Site. Dolomite, shale, and limestone formations of the Clinton Group underlie the Lockport Group. Bedrock bedding generally strikes in an east-west direction and dips to the south at approximately 30 to 40 ft per mile (Johnston, 1964; La Sala, 1968; Yager and Kappel, 1987).

The uppermost bedrock formation underlying the Guterl Steel Site has been identified as the Goat Island Dolostone Formation of the Lockport Group (NYSDEC, 2000). The Goat Island Dolostone is generally a light olive-gray to brownish-gray, medium to fine crystalline, thick to massive bedded dolostone with a sugary texture. Stratigraphically below the Goat Island Formation is the Gasport Formation of the Lockport Group. The Gasport Formation contains dolomitic limestone of blue to gray color, generally coarsely crystalline but with some fine crystalline layers. Bedding is massive with discontinuous shale partings and stylolites are common. This unit is underlain by the very finely crystalline, medium to dark gray in color DeCew Dolostone of the Clinton Group. The Rochester Shale of the Clinton Group, a dark bluish to brownish gray, calcareous shale with atypical argillaceous limestone layers, underlies the DeCew Dolostone (Tesmer and Bastedo, 1981, Brett et al., 1995).

Hydrogeologic studies completed in the Niagara Falls area provide regional information on the characteristics of fracturing and groundwater flow within rocks of the Lockport Group. The major water-bearing units in the Niagara region are in the bedrock above the Rochester Shale. Groundwater within the Lockport Group occurs primarily in the secondary porosity features such as weathered surface fractures, bedding planes, vertical joints, and small cavities and vugs. The bedding planes, which transmit most of the water in the Lockport Group are relatively continuous fracture planes parallel to the natural layering of the rock. The upper 10 to 25 ft of this unit can be heavily weathered, and often contain abundant bedding planes and vertical fractures enlarged by dissolution and glacial scour (Miller and Kappel, 1987).

In the Niagara Falls area, weathered bedrock surface and horizontal fracture zones near stratigraphic contacts in the Lockport Group have been identified as principal water-bearing zones. Closely spaced horizontal fractures that are connected by high-angle fractures have been

observed. A wide range of hydraulic conductivity values obtained from slug tests (0.003 to 570 ft/day), and constant-head injection tests (0.2 to 200 ft/day) have been reported. An overpressured natural gas reservoir, which underlies the Lockport Group, restricts vertical flow of groundwater (Tepper; et.al., 1991, Yager, 1993).

4.1.1 Site Geology

Based on previous remedial investigations, unconsolidated materials overlying the bedrock surface at the Guterl Steel Site have been characterized as relatively thin to discontinuous layers of glaciolacustrine deposits, glacial till, and fill material (overburden soil). Native soils consist of silts and clays with varying amounts of sand and bedrock fragments. The fill material, where encountered, has been described as coal fragments, apparent ash and coke fragments, and brick or crushed stone. For discussion purposes in this document, these unconsolidated materials will be named the overburden soil.

In borings advanced for monitoring wells installed in 2011, a thin surficial layer of silty sand to clayey silt topsoil underlain by silty clay was encountered at most locations. Fill materials described as foundry brick, cinders, sand, and gravel were noted at several locations (701DD, 702DD, 710D, 710DD, 712D, and 713D). An interval of concrete, approximately 2-ft thick, was found in the boring for 711D at a depth of 7 to 9 ft, directly overlying the bedrock surface. Overburden soil material descriptions are presented on boring logs contained in Appendix E.

The unconsolidated soil thickness in borings completed in 2011 ranged from 1.7 to 7.6 ft. A soil (undifferentiated) overburden thickness map based on the 2011 borings, and well borings completed during previous assessments, is presented as Figure 4-1. In general, overburden is thinner in the southern part of the Guterl Steel Site and thicker in the northwest corner. Overburden thickness (Figure 4-1) is generally 4.5 to 9 ft in the northwest area of the Guterl Steel Site, 3.5 to 5 ft in the buildings area of the former facility, and 2 to 3 ft south of the buildings area. Elevation data were also used to prepare a top of bedrock surface elevation contour map presented as Figure 4-2. As shown on Figure 4-2, the top of bedrock elevation is highest in the northern area of the Guterl Steel Site and the bedrock surface slopes unevenly towards the south. A summary of the bedrock surface elevation data is contained in Table 4-1.

Bedrock underlying the Guterl Steel Site was described as medium gray to light gray dolomite; at two locations (706DD, 708DD) and the dolomite was noted as brownish gray near the top. The upper part of the dolomite, which constitutes the shallow weathered bedrock, was observed to contain numerous horizontal fractures. Vertical and angled fractures with much less frequency were also identified. Many of the fractures were noted to be weathered and/or clay filled. Vugs, calcite-filled vugs, and voids were also found generally in the upper 25 to 30 ft of bedrock.

The lower portion of the bedrock, starting at depths of 20 to 25 ft below the overburden and shallow weathered bedrock interface, is not weathered and has distinct fractures. The fracture

density in this zone is lower than that in the shallow weathered bedrock and decreases with depth. This zone is called the first main fracture zone, and extends to a depth of approximately 40 ft below the bottom of the shallow weathered bedrock. The first main fracture zone is underlain by shaly dolostone, and is estimated to be 20 to 30 ft thick with few to no fractures. The shaly dolostone in turn is underlain by Rochester Shale.

The stratigraphic order at the site, starting from ground surface is summarized follows:

- Overburden soil
- Shallow weathered bedrock (shallow groundwater)
- First main fracture zone (deep groundwater)
- Shaly dolostone (no monitoring wells installed)
- Rochester Shale (no monitoring wells installed)

Dark gray shaly dolomite was encountered in Borings 701DD and 709DD at depths of approximately 60 to 65 ft to the total depths of these borings, which were advanced to 80 ft. The shaly dolomite noted in these two borings is believed to represent a stratigraphic transition into the Rochester Shale Formation.

Geologic cross sections were constructed using subsurface information from well installations on the Guterl Steel Site. Locations of the cross sections are shown on Figure 4-3. Cross Sections A – A' through E – E' are presented as Figures 4-4 through 4-8. Cross Sections A – A' through C – C' were made to extend through the Erie Canal. The base of the canal and water levels shown in the canal are based on elevation and gauge reading data obtained from Lock 35 in Lockport. The water level shown in the canal represents the navigation season water level. From mid-November through April, the canal has an average of 2 ft of water (Rick Manns, Erie Canal Corp., Telecommunication, September 2011).

Horizontal fractures interpreted from the boring log descriptions and Rock Quality Designation (RQD) values calculated for each 5-ft rock core interval of the 2011 borings are included on the cross sections. A decrease in the density of fracturing with depth, as shown by RQD values, is apparent. A differentiation between relatively high fracture density and lower fracture density within the bedrock was made by identifying intervals where RQD is lower than or greater than 80 percent. As shown on the cross sections, bedrock intervals with lower than 80 percent RQD are generally within the top 20 to 25 ft of the bedrock surface. High fracture density zones are also present in deeper intervals at MW-708DD and MW-712DD; these high fracture density zones are shown on Cross Sections B – B' and E – E' as discontinuous zones within relatively lower fracture density bedrock.

A fracture trace analysis was conducted at the Guterl Steel Site and surrounding area by the Army Geospatial Center (AGC) to support characterization of surficial terrain features that may influence pathways for contaminant flow. The AGC report, completed in March 2010 and included in Appendix K, presents linear features discovered by examination of aerial

photographs using imagery at a scale of 1:20,000. Results of the analysis were compared to a broader study completed by New York State using imagery at a scale of 1:250,000. As would be expected, more fracture traces and lineaments are seen in a specific area if the scale is larger for that local area. Results of the AGC analysis are shown in rose diagrams presented for study areas covering a 0.5-mile and a 1-mile radius from the Guterl Steel Site. The half-mile radius study area rose diagram shows that a majority of fractures are oriented northwest-southeast and a lesser amount are oriented east-northeast/west-southwest. The one-mile radius study area diagram indicates similar orientations with the northwest-southeast and east-northeast/west-southwest components approximately equal. The five-mile study area rose diagram (from the New York State analysis) shows that a majority of the fractures are oriented east-west with much fewer northwest-southeast and east-northeast/west-southwest components. The half-mile and one-mile radius study areas showing fracture traces and corresponding rose diagrams from the AGC report are presented on Figure 4-9. A view of the fracture trace lineaments found in the Guterl Steel Site area show a general northwest-southeast fracture trace orientation pattern north of the Erie Canal and a general northeast-southwest orientation south of the canal. Also, upon inspection of individual lineaments, three northwest-southeast trending fracture traces and one northeast-southwest trending fracture trace can be observed directly on the Guterl Steel Site. Northwest-southeast trending fracture trace spacing in the Guterl Steel Site area is on the order of 200 to 1,000 ft. Northeast-southwest trending fracture trace spacing in the Guterl Steel Site area is wider, at roughly 2,000 ft. Fracture density in the Guterl Steel Site area appears greater than the surrounding area within the study area; however, housing development in the northern part of the study area may obscure the surface expression of linear features.

4.1.2 Site Hydrogeology

Hydrogeologic information on unconsolidated soil at the Guterl Steel Site is limited, mainly due to the thin to discontinuous presence of this unit. Overburden monitoring wells were installed in unconsolidated soil in the area of the landfill during previous investigations. A limited set of historical water level measurements exist for these wells. During the RI, the landfill area overburden monitoring wells were observed to be either dry (MW-13S) or in an unusable deteriorated condition (MW-81-01, MW-81-02, MW-81-04, and MW-105). Conclusions made indicate that water levels in the overburden (landfill area) fluctuate widely (up to 4 ft) with two wells going dry during the summer months (NYSDEC, 2000). Available gauging data for MW-13S indicate that groundwater has not been detected in this well. Available water level data for MW-600S indicate a water column of less than 0.6 ft. Monitoring well gauging data collected at the Guterl Steel Site on August 3, 2011 is included on Table 4-1.

Groundwater levels in the shallow bedrock monitoring wells installed in the shallow groundwater which occurs in the shallow weathered bedrock have been observed during previous investigations to stabilize at, or above, the bedrock surface at many of the well locations. Water levels in shallow bedrock monitoring wells installed in 2011 stabilized at levels 3 to 8 ft below

the top of bedrock; however, the 2011 shallow bedrock wells were installed on the southern part of the Guterl Steel Site where water levels are deeper. One shallow bedrock well (MW-712D), which was installed in 2011, was dry. Depths to water in the remaining shallow bedrock wells during the August 2011 gauging event ranged from 3 ft bgs (MW-23) to 10.5 ft bgs (MW-711D). Figure 4-10 presents a comparison of water levels in shallow bedrock monitoring wells relative to the bedrock surface. Locations where water levels are above the bedrock surface are mostly in the vicinity of the former facility buildings.

Water levels in the deep bedrock wells installed in the deep groundwater which occurs in the first main fracture zone are more variable than in the shallow bedrock and range from 3.3 ft bgs (MW-704DD) to 35.4 ft bgs (MW-707DD).

4.1.2.1 Groundwater Flow

Vertical hydraulic gradients have been calculated using August 2011 groundwater elevation data from nested shallow and deep bedrock wells (or shallow and deep wells located in close proximity). Results presented on Figure 4-11 show whether an upward (positive values) or downward (negative values) flow component is indicated and the magnitude. Most locations show a slight downward flow component or are near coincident (magnitude less than 0.01 can be considered near coincident). An upward gradient greater than 0.01 is indicated at two locations, the MW-713D/MW-708DD and the MW-711D/MW-711DD areas. A strong downward gradient (-1.39) is indicated at the MW-26/MW-707DD location, and at the MW-712D/MW-712DD location shallow groundwater is apparently drained (the shallow well is dry).

Groundwater potentiometric surface maps prepared using the August 2011 gauging data are presented as Figures 4-12 and 4-13. Shallow bedrock groundwater elevation data from wells screened within the upper 23 ft of bedrock were used to generate the map shown on Figure 4-12. This map includes data from the existing shallow bedrock wells and the five shallow bedrock wells installed in 2011. Figure 4-13 presents potentiometric surface contours using data from the 12 monitoring wells screened within the 29 to 40-ft interval (deep bedrock wells) that were installed in the first main fracture zone in 2011.

The shallow groundwater potentiometric surface map shows a generally southward flow direction with the highest groundwater elevations in the northern area of the Guterl Steel Site. A groundwater divide oriented northwest to southeast that originates in the northwestern area of the Guterl Steel Site is apparent on Figure 4-12. West of the divide, the groundwater flow direction is towards the quarry at a horizontal gradient of 0.0072 using the elevations and distance (measured along the groundwater flow path, perpendicular to the contours) from MW-18 and MW-705D. South and east of the divide, groundwater flow is to the southeast towards the canal. In the area of the former facility buildings, the horizontal gradient is relatively low at 0.0008 (measured between MW-605D and MW-25). The horizontal gradient in the shallow weathered

bedrock aquifer increases to 0.0602 (measured between MW-604D and MW-712D) south of the former buildings area towards the canal.

The deep groundwater potentiometric surface map (Figure 4-13) shows a similar pattern to the shallow groundwater contours with an apparent general groundwater flow direction to the southeast towards the canal. A relatively steep gradient is present in the vicinity of MW-703DD on the northwest area of the Guterl Steel Site. The August 2011 groundwater elevation at MW-703DD (574.39 ft msl) is much lower than elevations in the nearest deep bedrock wells MW-701DD (596.16 ft msl) and MW-705DD (591.47 ft msl), indicating a westerly groundwater flow component in that area of the Guterl Steel Site. The groundwater elevation at MW-707DD, located near the center of the Guterl Steel Site, was not used in contouring due to an anomalously low water level (561.22 ft msl) gauged in that well. The horizontal gradient on the western area of the Guterl Steel Site is 0.0633 (measured between MW-705DD and MW-703DD). The gradient in the buildings area is much lower at 0.0080 (measured between MW-704DD and MW-709DD). South of the facility, towards the canal, the gradient increases to 0.0891 (measured between MW-709DD and MW-712DD).

Based on elevations of the two seeps along the northern rock face of the canal (see Cross Sections A – A' and C – C') and elevation of the base of the shallow bedrock, groundwater from the shallow bedrock zone may be discharging to the surface as seeps. Groundwater discharge to the ground surface from the shallow weathered bedrock is likely limited by the mostly downward vertical groundwater flow gradient.

4.1.2.2 Hydraulic Conductivity

Results of slug tests conducted on the newly installed monitoring wells in August 2011 were reduced to obtain horizontal hydraulic conductivity values for each of the tested wells. Hydraulic conductivity testing was not performed at MW-707DD and MW-712D due to insufficient water column in these two wells. The test data were reduced using analytical methods appropriate for the testing situation for each well. The slug test data were reduced using Aqtesolv Pro Version 4.5 software. Analytical solutions that were utilized included the Kansas Geological Survey Model, (Hyder et. al., 1994) and Bouwer and Rice method (Bouwer and Rice, 1976). Slug test types (rising head, falling head) and analytical solutions were selected for analysis depending on the well configuration and displacement that was achieved during each test. Data from pneumatic tests were used in most cases to compute hydraulic conductivity values. Where water levels in the wells were below or near the top of the screened interval or water level recovery data contradicted observations made during well development, applicable solid slug test data were used. Results for each test reduction and average hydraulic conductivity results for each well tested are summarized on Table 4-2. Previous assessment results are also included in Table 4-2. Slug test displacement-time plots for hydraulic conductivity testing

conducted in 2011 are contained in Appendix G. Hydraulic conductivity values for each of the tested shallow and deep bedrock wells are presented on Figures 4-14 and 4-15, respectively.

Hydraulic conductivity values obtained for the shallow bedrock wells range from 0.024 ft/day at MW-705D to 218 ft/day at MW-3. Average and median values for hydraulic conductivity in the shallow weathered bedrock (shallow groundwater) are 27.8 ft/day and 11.9 ft/day, respectively. Hydraulic conductivity values obtained for the deep bedrock wells range from 0.0009 ft/day at MW-711DD to 41.4 ft/day at MW-712DD. Average and median values for hydraulic conductivity in the first main fracture zone (deep groundwater) are 7.5 ft/day and 3.2 ft/day, respectively.

The difference in hydraulic conductivities between the shallow weathered bedrock and the first main fracture zone was reflected in the production rates measured in monitoring wells during well development and sampling, and response times to slugs during slug testing; which confirmed the interpretation of slug test data.

4.2 Extent of Contamination

Uranium concentrations detected in groundwater during the August 2011 sampling event are summarized on Table 4-3 and are presented in Figures 4-16 and 4-17. Table 4-3 contains results for unfiltered groundwater samples and filtered sample results and a comparison of the results (unfiltered versus filtered) for total uranium in mass units micrograms per liter (µg/L). There is a relatively small difference between unfiltered and filtered concentrations; in most cases the unfiltered results are slightly higher in concentration due to the presence of suspended solids. The maximum difference is 12.4 µg/L in the samples collected from MW-26 (unfiltered concentration: 107 µg/L; filtered concentration: 94.6 µg/L). The difference in concentrations for a majority of the samples is less than 5 µg/L (average difference: 0.73 µg/L; median difference: 0.20 µg/L). Therefore, the remainder of discussion on the extent of uranium in groundwater will reference filtered (dissolved) concentrations of total uranium.

Isoconcentration maps of dissolved uranium were prepared based on the August 2011 analytical results. Total uranium results for groundwater samples collected from the shallow bedrock monitoring wells are presented on Figure 4-16. The highest uranium concentration (209 µg/L and 212 µg/L in the duplicate sample) detected in groundwater was in the shallow bedrock well MW-605D located near the center of the Guterl Steel Site. Concentrations greater than 90 µg/L were detected north of Buildings 14 and 47, and appear to trend in a northwest to southeast direction across the Guterl Steel Site towards the canal. A concentration of 44.9 µg/L was detected at the furthest existing downgradient sampling point (Seep 01) characterized to be a potential discharge point for shallow weathered bedrock groundwater. Sampling results for Seep 02 indicated a much lower uranium concentration (6.3 µg/L).

Isoconcentration maps of dissolved uranium were prepared based on the September 2009 and the September 2010 analytical results as shown on Figures 4-18 and 4-19. A comparison of these figures to the dissolved uranium plume for 2011, suggests that the size and shape of the plume has remained stable. This is supported by a time-trend analysis performed for dissolved uranium provided in Appendix L and summarized herein. Trends at all 30 wells (impacted and unimpacted wells sampled four or more times) were evaluated using the Kendall-Tau test. Test results are shown in Appendix L, Table 1. Only 3 of the 30 wells showed significant trends. MW-3 is a background well with a significant downward trend, and MW-603D is a background well with a significant upward trend. One impacted well, MW-24, had a significant upward trend with concentrations that increased from 5.49 to 35.08 µg/L in the four successive samples. For the remaining wells, no statistically significant trends in uranium concentrations are detectable at these wells over the four-year monitoring period. However, it should be noted that four samples obtained over a 4-year period may be insufficient to detect upward or downward trends in wells with shallow slopes. More information is provided in Appendix L.

Results of the total uranium concentrations in deep groundwater in the first main fracture zone are presented on Figure 4-17 for unfiltered and filtered dissolved uranium, respectively. The distribution of uranium in deep groundwater appears in a similar orientation as the shallow groundwater; however, the plume is much smaller. The highest concentration (67 µg/L) was detected in MW-710DD, located near the southeastern Guterl Steel Site boundary.

4.3 Geotechnical Results

Geotechnical samples from the borings were submitted to Shaw's in-house Geotechnical Testing Laboratory located in Knoxville, Tennessee. Samples were received by the laboratory on August 18, 2011. The following analyses were performed in the laboratory:

- Bulk density by ASTM D2937-10
- Uranium partitioning coefficient Kd by modified ASTM D4646
- Total porosity by EM-1110-2-1906 (USACE, 1986)

These analyses were performed in accordance with the DGI work scope requirements to provide results for bulk density, Kd, and effective porosity. Since effective porosity is not directly measurable, it was calculated from the total porosity and the degree of saturation measurements made on the samples.

All analyses were performed following method specifications. Twenty-four hour non-equilibrium desorption coefficients were calculated using a modified ASTM D4646. The method was modified to determine soil desorption using Synthetic Precipitation Leaching Procedure (east) fluid as defined in SW-846 Method 1312, which was then air saturated.

The uranium concentrations in the 24-hour solutes for sample 702 DD soil and its duplicates were found at concentrations between the method detection limit and the lowest standard, and therefore, the Kd for this sample has been estimated.

A copy of the geotechnical laboratory report is included in Appendix J.

Table 4-4 presents the results of the bulk density, total porosity and dry density tests that were used to compute effective porosities. Bulk density measurements ranged from 1.24 grams per cubic centimeter (g/cm^3) to 2.08 g/cm^3, with an average value of 1.70 g/cm^3; while the dry density measurements ranged from 1.04 g/cm^3 to 1.82 g/cm^3, with an average value of 1.48 g/cm^3. Total and effective porosity ranges were 0.39 to 0.60 and 0.11 to 0.42, respectively, with the average total porosity calculated as 0.46 and the average effective porosity calculated as 0.25.

Table 4-5 presents the results of the Kd analyses. Kd analyses were performed in triplicate, and the data indicates a good match between the three analyses. Kd values ranged from 1,052 milliliter per gram (mL/g) to 95,667 mL/g, with an average value of 17,699 mL/g. Since the Kd data displayed a large range, a geometric mean of 5,722 mL/g was calculated to indicate the central tendency or typical value of the data set.

The Kd values reported in this report were derived from soil samples that were collected in unsaturated soil overlying the shallow groundwater present in the shallow weathered bedrock. These Kd values represent the potential for the infiltrating rainwater to desorb uranium from the unsaturated soil and leach into the underlying groundwater. The soil samples used for the Kd analysis were collected from areas where the soil uranium concentrations were less than the source area soils and, therefore, may not directly indicate the desorption potential for uranium in the source areas.

4.4 Uranium Geochemistry

Uranium concentrations in the 57 filtered groundwater samples (including duplicates) obtained in 2011 range from 0.28 µg/L to 214 µg/L as determined by Inductively Coupled Plasma/Mass Spectrometer (ICP/MS) method. These samples were also analyzed for uranium via alpha spectroscopy, which determines the individual activities of the ^{234}U, ^{235}U, and ^{238}U isotopes. The isotopic uranium results are presented in Table 4-6. These results allow an independent comparison of uranium concentrations by two different analytical methods in each sample. Figure 4-20 shows the uranium concentrations in each of the 2011 samples as determined via ICP/MS (x axis) versus the three uranium isotope activities determined by alpha spectroscopy, converted to mass concentration units (µg/L) and summed (y axis). Shallow samples are shown with diamond symbols and deep samples are shown with squares. The dashed line on the figure labeled "y=x" is the trend expected for perfect agreement between the two methods. The majority of the points fall on or very close to the dashed line, indicating good agreement between

the two methods. The median isotopic uranium to ICP/MS uranium ratio is 0.964 and the mean isotopic uranium to ICP/MS uranium ratio is 0.934, which verifies the close agreement. The closeness of the points to the y=x line, the symmetry of the points about the y=x line, and the mean and median ratios close to 1.0 indicate general agreement and lack of bias in either of the analytical methods for uranium.

The isotopic uranium results for the 2011 sampling event indicate that only natural uranium was present in the samples (depleted, enriched, or recycled was not identified in the samples). Enriched uranium can be identified by $^{234}U/^{238}U$ activity ratios that are greater than 7.0, depleted uranium has ratios less than 0.2, and natural uranium has ratios in the range of 1.0 to 3.0 (Goldstein, 1997).

Figure 4-21 shows the correlation between the alpha spectroscopy results for ^{234}U versus ^{238}U in activity units (picoCuries per liter [pCi/L]) in the shallow and deep samples. The dashed line on the figure labeled "y=x" is the trend expected if the ^{234}U and ^{238}U activities are identical in each sample. Also shown on Figure 4-21 are linear regressions of the two data sets. Samples from the shallow and deep units show strong correlations ($R^2 > 0.97$) between the two isotope activities and the two trends are coincident. The slopes of the linear regressions of the two data sets, which represent the average $^{234}U/^{238}U$ activity ratios, are both close to 1.0 (±0.004), and the y-intercepts are close to 0.0 (±1.0), which is a fingerprint for natural uranium.

Uranium detected in the 2011 samples is predominantly present in a dissolved state. The ratios of uranium concentrations (ICP/MS method) in filtered versus unfiltered sample splits in the 2011 shallow and deep samples are shown as a function of the unfiltered uranium concentrations in Figure 4-22. Samples with uranium present in a mostly dissolved state should have ratios close to 1.0, and samples with uranium present as suspended particulates should have ratios less than 1.0 (Thorbjornsen and Myers, 2007). Greater scatter in the filtered/unfiltered ratios is observed at lower concentrations where the uncertainties in concentrations increase. However, the majority of the samples line up as a vertical trend over a ratio of 1.0 (dashed line), indicating that the uranium detected in the samples is not removable by filtration and is, therefore, mostly present in a dissolved state.

4.4.1 Uranium Solubility and Speciation

Under oxidizing conditions, hexavalent uranium exists in pure water as a mix of the uranyl ion [UO_2^{2+}] and hydrolyzed uranyl species [UO_2OH^+, $UO_2(OH)_2^o$, $UO_2(OH)_3^-$], depending on local pH (Paquett and Lemire, 1981). These forms of uranium have moderate solubilities over the neutral pH range. Uranium in pure water with a pH of 7 and oxidation reduction (redox) potential (+400 millivolts [mV]) that is in equilibrium with schoepite ($UO_3 \bullet 2H_2O$), which is the most stable hexavalent uranium mineral, has a solubility of approximately 1 milligram per liter (mg/L).

The addition of dissolved carbonate in the water can increase this solubility by a large amount. The uranyl ion has a very strong affinity to form aqueous complexes with the carbonate ion (CO_3^{2-}) in varying combinations, depending on total carbonate concentrations and pH (Jensen, 1982). The addition of dissolved calcium carbonate (50 mg/L Ca^{2+} and 150 mg/L HCO_3^-) to oxic, neutral pH water increases uranium solubility from approximately 1 mg/L to 38 mg/L. The dominant dissolved uranium species in this carbonate-bearing water are $UO_2CO_3^o$, $UO_2(CO_3)_2^{2-}$, and $UO_2(CO_3)_3^{4-}$. The uranyl di- and tri-carbonate species are favored at higher pH conditions where more of the total dissolved carbonate is present as CO_3^{2-} rather than bicarbonate (HCO_3^-) or carbonic acid (H_2CO_3), which are the dominant forms under lower pH conditions.

The dominant uranyl-carbonate species as a function of the true redox potential (Eh) and pH are provided in Figure 4-23. The presence of dissolved carbonate in the groundwater increases the solubility of uranium due to the formation of these mono-, di-, and tri-carbonate species. High total carbonate concentrations also have the effect of expanding the soluble hexavalent uranium stability field at the expense of the low-solubility uraninite field on the Figure 4-23.

In addition, the large ionic radii of these uranyl-carbonate species limit their adsorption affinity, and their negative charges result in adsorption that is restricted to positively charged mineral surfaces such as iron oxides and organic carbon. Some adsorption of these uranium species is expected in soil and weathered bedrock where iron oxides and organic material are present, but less adsorption is expected in the dolostone aquifer environment where positively charged mineral surfaces and organic carbon are not abundant.

Under reducing conditions, uranium exists in the tetravalent form where its mobility is limited by very low solubilities (Brookins, 1988). The tetravalent form of uranium precipitates as uraninite (UO_2), which has a solubility that is approximately six orders of magnitude lower than hexavalent uranium minerals such as schoepite. The stability field for tetravalent uranium is shown on the lower portion of Figure 4-23 where uraninite precipitates.

Uranium in pure water with a pH of 7 and a redox potential of -50 mV has solubility with respect to uraninite of 0.0001 mg/L, and is dominantly present in solution as the neutral speci $U(OH)_4^o$. Redox potentials below -50 mV have even lower solubilities.

In summary, the mobility of uranium in groundwater is the most sensitive to redox conditions, being very low (less that 0.0001 mg/L) under reducing conditions, and is much higher (tens of mg/L or more) under oxidizing conditions. In an oxidizing environment, uranium solubilities are sensitive to total dissolved carbonate and pH, with higher carbonate concentrations and higher pH contributing to higher solubilities.

4.4.2 Oxidation Reduction Conditions

Most shallow aquifers have oxidizing conditions unless they are overlain by swamps or wetlands where decaying organic material such as leaves, wood, and peat can create naturally reducing

environments. Such wetlands do not exist at the Guterl Steel Site. However, the presence of organic contaminants such as hydrocarbon fuel compounds or chlorinated solvents can, under some circumstances, create local reducing conditions if they are subject to anaerobic microbial degradation.

Samples from several of the wells have detectable concentrations of the chlorinated solvents 1,1,1-trichloroethane; 1,1-dichlororethane; 1,1-dichlororethene; chloroethane; chloroform; tetrachloroethene; 1,2-dichlororethene; trichloroethene; and vinyl chloride. Figures 4-24 and 4-25 show the spatial distributions of VOCs in the shallow and deep groundwater units, respectively. Table 4-7 presents the analytical results for VOCs in groundwater.

Vinyl chloride and the *cis* isomer of 1,2-dichlororethene are microbial degradation products of trichloroethene, and their presence usually indicates reducing conditions. However, effective degradation of these solvents requires a specific set of conditions conducive to anaerobic microbial activity, including DO concentrations below 0.5 mg/L, ORP below 100 mV, nitrate below 1 mg/L, total organic carbon concentrations above approximately 20 mg/L, and sulfate concentrations below 20 mg/L (USEPA, 1998). Solvents can persist in groundwater for long periods of time and not establish a reducing environment if those conditions are not met.

The major element compositions of the shallow and deep samples are shown as Stiff diagrams on Figures 4-26 and 4-27. The metals results are presented in Table 4-8 and the anion results are presented in Table 4-9. Stiff diagrams are created by plotting the equivalent concentration (in milli-equivalents per kilogram) of the major cations (sodium, potassium, calcium, and magnesium) to the left of the center axis and major anions (chloride, carbonate, and sulfate) to the right of the center axis. The points are connected to form a six-sided polygon whose shape describes the water composition (Hounslow, 1995).

Sulfate concentrations at the wells (bottom right axis on the Stiff diagrams) range from 21 mg/L to 2,170 mg/L, suggesting that anaerobic sulfate-reducing conditions do not exist in the subsurface. The presence of sulfate in this range of concentrations acts as a redox buffer, preventing redox conditions from falling below the sulfate stability field until most of the sulfate gets reduced to sulfide.

Standard methods for estimating aquifer redox conditions include field measurements of DO and ORP. Traditional DO probes are based on membrane-covered electrochemical sensors, which are either polarographic or galvanic cells. These sensors require that a constant current be applied, which requires a stable power supply. Frequent calibration and extensive maintenance is required to ensure accurate results. In addition, the reaction consumes oxygen, so a constant flow of water must be provided. Insufficient flow will yield a low bias in the results.

Optical DO sensors were used for the first time in the 2011 sampling event. These relatively new sensors use a luminescent approach. An oxygen-specific lumiphore embedded in a gas-permeable sensing foil is illuminated with a blue light-emitting diode, which causes the

lumiphore molecules to emit red photons. DO acts as a dynamic luminescence quencher so the lifetime of luminescence is inversely proportional to the DO concentration. The optical probes have a lower limit of detection of 0.1 mg/L compared to approximately 0.5 mg/L for the older electrochemical sensors, and are more accurate in the lower concentration range. The 2011 DO measurements range from 0.18 to 6.28 mg/L, with a median of 0.43 and a mean of 0.83 mg/L. All of these measurements represent redox conditions where the hexavalent form of uranium is stable.

ORP probes measure the voltage between a reference electrode and a sensing electrode. The voltage developed between the two electrodes is proportional to the true redox potential (Eh). The 2011 field measurements were performed with a YSI brand ORP probe, which uses a silver/silver-chloride reference electrode. These ORP measurements were converted to the standard thermodynamic Eh scale by adding 200 mV to the field measurements. The converted Eh values range from 34.6 mV to +350 mV with a median of 204 mV and a mean of 192 mV. Only one measurement (MW-705D) was in the negative range. Although moderately reducing conditions are observed at some locations, all of these measurements represent conditions where the hexavalent form of uranium is stable.

A useful check on the consistency of DO and ORP measurements is to plot the results against each other on an x-y plot as shown in Figure 4-28. Measurements from shallow wells are shown as diamonds and deep wells are shown as squares. A linear correlation is not expected because DO concentrations above approximately 1 mg/L correspond to relatively high (> +200 mV) Eh conditions. Most of the wells with DO greater than 1 mg/L have Eh above +200 mV, and most of the wells with Eh below +200 mV have DO below 1 mg/L. These DO and ORP results are as consistent as can be expected for qualitative field measurements, and independently indicate that redox conditions at the sampled shallow and deep locations are in the range where hexavalent uranium is the stable form.

The behavior of iron in groundwater provides an additional independent redox indicator. Under oxidizing conditions, iron is present in the ferric (Fe^{+3}) valence state, which has a very low solubility that is below standard detection limits. Detections of iron in oxic unfiltered water samples are usually due to the presence of suspended iron oxide particulates that are removable by filtration. Under reducing conditions, iron is present in the ferrous (Fe^{+2}) valence state that is soluble up to several tens of mg/L and will pass through a standard 0.45 micron filter. The fraction of iron that passes through a filter can thus be used to determine if a sample is oxidizing or reducing with respect to iron redox reactions. The metals results are presented in Table 4-8. Figure 4-29 shows iron concentrations in unfiltered samples versus their corresponding filtered/unfiltered ratios. Samples that line up vertically over a ratio of approximately 1.0 (dashed line) are reducing with respect to iron redox reactions, and samples that fall to the left of the dashed line have some fraction of the iron removed after filtration indicating oxidizing conditions with respect to iron redox reactions. The majority of the samples show one or two

orders magnitude decrease in iron concentrations after filtration, indicating oxidizing conditions, but some shallow samples have iron in solution.

These results confirm that there is a wide range of redox conditions present across the Guterl Steel Site. However, the redox potential at which ferric iron reduces to the soluble ferrous form is considerably higher than the redox potential at which hexavalent uranium reduces to tetravalent uranium and precipitates. At a pH of 7, ferric iron reduces to ferrous iron at an Eh of approximately +220 mV, whereas hexavalent uranium reduces to tetravalent uranium at an Eh of -50 mV.

These iron results are consistent with redox information derived from DO and ORP measurements. In addition, the presence of dissolved sulfate at concentrations ranging from 21 mg/L to 2,170 mg/L, as previously discussed, provides additional independent evidence that redox conditions are not in the strongly reducing range necessary for reduction of hexavalent uranium to the insoluble tetravalent form.

4.4.3 Uranium Mobility

The mobility of a metal such as uranium can be limited in an aquifer by a solubility limit, by adsorption on mineral surfaces, or by a combination of both processes. The assessment of redox conditions in the shallow and deep water-bearing units, discussed previously, indicates that the hexavalent form of uranium is stable. The solubility of hexavalent uranium in pure oxidizing water with a pH of 7.0 is approximately 1 mg/L, and the presence of dissolved carbonate and pH conditions above 7.0 contribute to even higher solubilities. The mean pH in samples from the shallow wells is 7.24 and in the deep wells is 7.68. The average alkalinity (a measure of total dissolved carbonate) is 351 mg/L (as calcite [$CaCO_3$]), and is controlled by equilibrium with dolomite [$CaMg(CO_3)_2$] and $CaCO_3$, which are the major minerals present in the dolostone bedrock and partially weathered upper zone.

The spatial distributions of uranium in the shallow and deep units are shown in Figures 4-16 and 4-17. Uranium concentrations in filtered samples obtained in 2011 range from 0.28 µg/L to 214 µg/L, with a median of 13.3 µg/L and a mean of 37.8 µg/L. The highest uranium concentration was observed in a sample from MW-605D (a concentration of 209 µg/L with a concentration of 212 µg/L in the duplicate sample). The solubility of uranium at this well was calculated by Geochemist's Workbench (GWB) (Bethke and Yeakel, 2010) is 214 mg/L, which is three orders of magnitude higher than the observed uranium concentration.

The sample with the lowest Eh of -34.5 mV is from MW-705D. Water of this composition would be expected to have the lowest uranium solubility. The solubility of uranium at this well as calculated by GWB is 125 mg/L, which is also in excess of the actual uranium concentration of 2.8 µg/L.

These geochemical modeling results show that uranium in groundwater with the observed range of compositions (pH mostly above 7.0 and high carbonate concentrations controlled by equilibrium with carbonate minerals), requires extremely reducing conditions for it to reduce to the tetravalent form and precipitate as insoluble oxides. Although moderately reducing conditions exist at some locations, the uranium is predicted based on modeling results to be in the soluble hexavalent form at all of the sampled locations. Uranium mobility is therefore not limited by precipitation, but will be controlled by sorption along groundwater flow paths.

4.5 Sanitary Sewer Sampling Results

At the request of the City of Lockport, solid and liquid samples were collected from two sanitary sewer locations. These data were requested by the City to assess municipal worker safety. The results are presented in Tables 4-10 and 4-11, and Figure 4-30.

The sample from Sewer #1 was collected from the accessible manhole closest to the facility. The sample from Sewer #2 was collected from the next accessible manhole downstream. The results for the two solid samples, Sewer #1 and Sewer #2, respectively, are 0.27 and 0.47 picoCuries per gram (pCi/g) for ^{228}Th; 0.45 and 0.32 pCi/g for ^{230}Th; 0.22 and 0.44 pCi/g for ^{232}Th; 3.55 and 4.37 pCi/g for ^{234}U; 0.2 and 0.22 pCi/g for ^{235}U; and 3.72 and 4.77 pCi/g for ^{238}U.

The results for the two liquid samples, Sewer #1 and Sewer #2, respectively, are 10.9 and 0.43 pCi/L for ^{234}U; 0.61 and 0.04 pCi/L for ^{235}U; and 10.4 and 0.44 pCi/L for ^{238}U. The isotope ^{230}Th was detected in one sample, Sewer #1, at 0.03 pCi/L. The remaining thorium isotopes were not detected.

5.0 Revised Conceptual Site Model

A revised conceptual site model (CSM) was prepared on the basis of the Guterl Steel Site characterization data collected during the RI and the DGI. The CSM is a non-numeric model that consolidates the geologic, hydrologic, analytical, and surface water data into a unified interpretation. Individual elements that were used to develop the CSM of the Guterl Steel Site are discussed in detail in Section 4.1.1 (Site Geology), Section 4.1.2 (Site Hydrogeology), and Section 4.2 (Extent of Contamination). In addition to the on-site data, off-site features (such as the Erie Canal and the quarry) that influence contaminant fate and transport on the Guterl Steel Site were included in the CSM. The CSM is presented graphically in Figure 5-1.

The subsurface lithology beneath the Guterl Steel Site consists of unconsolidated soil and shallow weathered bedrock that is underlain by fractured dolomite, with the degree of fracturing decreasing with depth. The dolomite grades into shaly dolomite and eventually is underlain by a shale bedrock unit.

The unconsolidated soil and shallow weathered bedrock unit consist of relatively thin to discontinuous layers of native soils derived from glacio-lacustrine deposits, glacial till, and fill material. Native soils consist of silts and clays with varying amounts of sand and bedrock fragments and are less permeable as compared to the fill material. With the exception of the landfill area and a location north of the north fence, where the overburden is 13 to 15 ft thick, the overburden is less than 5 ft across the Guterl Steel Site area.

Numerous horizontal fractures were documented in the shallow weathered bedrock consisting of top 20 to 25 ft of the dolostone rock that underlies the overburden. In addition, vertical and angled fractures were also identified. Many of the fractures were noted to be weathered and/or clay filled resulting in reduced transmissivity. Vugs, calcite-filled vugs, and voids were also found generally in the upper 25 to 30 ft of bedrock. The fracture density in dolostone decreased with depth between 25 to 65 ft bgs, which corresponds to the first main fracture zone. Correspondingly, the RQD, which is a rough measure of the degree of jointing or fracture in a rock mass, also decreased with depth. A RQD value of 80 percent was used to demarcate the boundary between the shallow weathered dolostone and the less fractured dolostone, which occurs at 25 to 30 ft bgs (first main fracture zone). Dark gray shaly dolostone was encountered at depths of approximately 60 to 65 ft bgs. The shaly dolostone is believed to transition into the Rochester Shale Formation at depths greater than 80 ft bgs. The Rochester Shale formation was not encountered in the boreholes that were drilled to depths of 80 ft bgs during the DGI.

Hydraulic conductivity values obtained for the shallow bedrock wells (bottom of screen up to 23 ft bgs) range from 0.024 ft/day to 218 ft/day. Hydraulic conductivity values obtained for the deep bedrock wells (bottom of screen up to 40 ft bgs) range from 0.0009 ft/day to 41.4 ft/day.

A portion of the precipitation that falls in the area as rain and snow infiltrates into the ground and recharges the groundwater system before either discharging to the Erie Canal or migrating to the deeper rock formations overlying the Rochester Shale Formation, where the groundwater flow direction has not been determined. The remainder of the precipitation is lost to the atmosphere through the processes of evaporation and transpiration through vegetation, or is directed as surface water runoff directed towards the Erie Canal. The infiltrating water moves vertically through the unsaturated overburden soil and weathered rock and then recharges the shallow groundwater.

Ground surface and the top of bedrock elevation are highest in the northern area of the Guterl Steel Site and slope unevenly towards the south towards the Erie Canal. The groundwater table is fairly shallow, and is encountered at depths ranging from 3 to 10.5 ft. Groundwater then flows through the shallow weathered bedrock and in the first main fracture zone of the dolostone, where shallow monitoring wells were installed during the RI, and additional shallow and deep monitoring wells were installed during the DGI. The shallow bedrock potentiometric surface map shows a generally southward flow direction with the highest groundwater elevations in the northern area of the Guterl Steel Site (Figure 4-12). A groundwater divide oriented northwest to southeast that originates in the northwestern area of the Site is apparent. West of the divide, the groundwater flow direction is towards the quarry. South and east of the divide, groundwater flow is to the southeast towards the Erie Canal. The deep groundwater shows a similar pattern to the shallow groundwater with an apparent general groundwater flow direction to the southeast towards the canal and a westerly groundwater flow component towards the quarry.

Seeps were observed along the northern rock face of the canal at only two locations in September 2011. The elevations of the two seeps are higher than the elevation of the base of the shallow weathered bedrock, indicating that groundwater from the shallow weathered bedrock may be discharging to the surface as seeps. From mid-November through April, the canal is not navigable and the water elevation in the canal is 10 to 12 ft lower than the elevation during the May through mid-November navigation season. The movement of deep groundwater in the canal area has not been determined. Potential pathways include flow directed into the canal, underneath the canal bottom, or possibly vertically into the deeper dolostone and shaly dolostone units where the flow directions have not been determined.

Groundwater in the shallow, as well as deep, wells within the dolostone was documented to be impacted with uranium. The processing of natural uranium metal at the Guterl Site resulted in dust, mill shavings and associated land disposal that contaminated on-site soils and facility buildings – the potential sources of the uranium-impacted groundwater. The highest uranium concentrations were detected in groundwater near the center of the Guterl Steel Site. The uranium plume centerline appears to trend in a northwest to southeast direction across the Guterl Steel Site, extending across the property boundary towards the canal. A portion of the uranium-

impacted water discharges to the canal, while the remainder appears to be directed towards the deeper bedrock units.

6.0 Conclusions

Based on the results of the DGI, the following conclusions are drawn:

- Total uranium is present at concentrations exceeding background in the deep groundwater flowing through the first main fracture zone of the competent dolostone, located between 30 and 40 ft deep and corresponds with the screened locations of the deep monitoring wells.
- The horizontal extent of groundwater with total uranium concentrations exceeding background covers approximately one third the area in the first main fracture zone (deep groundwater) compared to the shallow weathered bedrock (shallow groundwater). The areas exceeding background are primarily near the buildings in both zones.
- Groundwater with uranium concentrations exceeding background is discharging to the Erie Canal at the location of Seep 01.
- Hydraulic conductivity values are generally lower in the first main fracture zone than in the shallow weathered bedrock. Average and median values for hydraulic conductivity in the shallow weathered bedrock (shallow groundwater) are 27.8 ft/day and 11.9 ft/day, respectively. Average and median values for hydraulic conductivity in the first main fracture zone (deep bedrock) are 7.5 ft/day and 3.2 ft/day, respectively. The geometric means of hydraulic conductivity values in the shallow weathered bedrock and the first main fracture zone are 10 ft/day and 1 ft/day, respectively.
- The difference in hydraulic conductivities between the shallow weathered bedrock and the first main fracture zone was reflected in the production rates measured in monitoring wells during well development and sampling, and response times to slugs during slug testing, therefore confirming the interpretation of slug test data.
- Geotechnical test data indicate that Kd values ranged from 1,052 mL/g to 95,667 mL/g, with an average value of 17,699 mL/g and a geometric mean value of 5,722 mL/g. These values indicate that total uranium will preferentially remain bound to soil instead of desorbing to recharge water and leaching to groundwater. The Kd values reported in this report were derived from soil samples that were collected in unsaturated soil overlying the shallow groundwater present in the shallow weathered bedrock. These Kd values represent the potential for the infiltrating rainwater to desorb uranium from the unsaturated soil and leach into the underlying groundwater. The soil samples used for the Kd analysis were collected from areas where the soil uranium concentrations were less than the source area soils and, therefore, may not directly indicate the desorption potential for uranium in the source areas.

- Groundwater flow directions in the first main fracture zone (deep groundwater) are generally consistent with groundwater flow in the shallow weathered bedrock (shallow groundwater). Groundwater flow in both zones is generally to the south, but to the southeast toward the Erie Canal on the eastern part of the site and to the southwest toward the quarry on the western part of the site.
- The uranium isotope ratios are consistent with naturally occurring uranium (^{234}U and ^{238}U are present at equal concentrations by activity), indicating the uranium processed at the site was neither enriched nor depleted.
- Comparison of filtered and unfiltered total uranium results indicates most of the uranium present is dissolved. Approximately 98 percent of the total uranium was in the dissolved form in the samples collected.
- Geochemical conditions in the aquifer indicate total uranium will remain in a soluble form at all locations investigated. Redox conditions do not favor uranium precipitation.

The horizontal and vertical extent of uranium exceeding background has not been completely defined. Vertically, the DGI results determined that uranium-impacted groundwater occurs in the deep groundwater flowing through the first main fracture zone of the competent dolostone that underlies the shallow weathered bedrock (shallow groundwater), where uranium contaminated groundwater was documented to be present during the RI. There is another 40 to 45 ft of dolostone and shaly dolostone between the bottom of first main fracture zone of the competent dolostone and the Rochester Shale where the presence or absence of uranium impacted groundwater has not been determined.

Groundwater flow was observed to discharge at two locations along the northern rock face of the Erie Canal. This discharge represents a fraction of the groundwater flow that exits the shallow and the deep groundwater units underneath the site. Data collected during the DGI has not established the flow path where the remainder of the groundwater exits; potential routes include discharge to the quarry, flow underneath the Erie Canal, and flow to regional groundwater system through fractures in the dolostone and shaly dolostone that underlie the first main fracture zone of the competent dolostone.

The DGI results provide data on deep groundwater flow in the first main fracture zone of the competent dolostone, hydraulic conductivity and geotechnical data, nature and extent of total uranium shallow and deep groundwater plumes in the shallow weathered bedrock and the in the first main fracture zone of the competent dolostone, lithological characteristic of the rock units, and information on the locations of water producing fractures. Although there are gaps in data on horizontal and vertical characterization, the additional data collected during this investigation is sufficient to develop a numerical groundwater model for the site that will allow evaluation of groundwater flow and transport.

NOTE: Qualifier varies by analytical method - analytical method is noted in the description of the qualifier.

LabQual = Laboratory Qualifier

pCi/g = picoCuries per gram

mg/kg = milligrams per kilogram

ug/L = micrograms per Liter

B - 8260B = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

J - 6010B = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

J - 8260B = Estimated result. Result is less than RL.

U = Analyte analyzed for, but was not detected.

Notes:

Location coordinates and elevations for wells installed prior to 2011 from 2007 Remedial Investigation Report.

[a] ft msl = feet above mean sea level

[b] ft bgs = feet below ground surface

[c] feet above or below ground surface. Negative values indicate below grade installation.

[d] ft toc = feet below top of riser casing

[e] Negative values indicate water level below top of bedrock surface, positive values indicate water level above top of bedrock surface.

NM = not measured

TOC elevation data not available for MW-24, MW-25, and MW-26. These wells are flush-mounted (below grade). Water level elevations are referenced from ground surface.

NA = Not Applicable

The Bouwer_Rice (1976) method or the Butler (1998) eq. 6.11b method was used when the test well is screened across the water table and drainage from filter pack occurs.
The Butler (1998) eq. 3.1 method was used for cases other than drainage from filter pack when correction is needed for the observed initial displacement from solid slugs being less than the expected initial displacement.
The expected initial displacement is calculated as follows:
Slug dimensions = 1.25 inches diameter x 5 ft. length
Expected displacement = slug volume / casing volume per foot = slug length X (slug diameter / casing diameter) ^{2} = 5 ft x (1.25 inch/ 2 inch)^2 = 1.95 ft

NOTE: Qualifier varies by analytical method - analytical method is noted in the description of the qualifier.

pCi/L = picoCuries per Liter

ug/L = micrograms per Liter

ValQual = Validation Qualifier

J - A-01-R MOD = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

J - SW6020 = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

U = Analyte analyzed for, but was not detected.

ug/L = micrograms per Liter

B = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

D = Result was obtained from the analysis of a dilution.

E = Estimated result. Result concentration exceeds the calibration range.

J = Estimated result. Result is less than RL.

U = Analyte analyzed for, but was not detected.

LabQual = Laboratory Qualifier

LabQual = Laboratory Qualifier

ug/L = micrograms per Liter

E = Matrix interference.

B = Estimated result. Result is less than RL.

J = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

U = Analyte analyzed for, but was not detected.

Lab Qual = Laboratory Qualifier

mg/L = milligrams per Liter

B = Estimated result. Result is less than RL.

J = Method blank contamination. The associated method blank contains the target analyte at a reportable level.

U = Analyte analyzed for, but was not detected.

Evaluation of Uranium Concentration Trends

Appendix L

Evaluation of Uranium Concentration Trends

Time trends in uranium concentrations at 18 wells were evaluated using graphical and statistical methods to determine if any significant trends are present. The wells selected for evaluation had four or more sample events and uranium concentrations above 10 µg/L in one or more samples. This concentration screening value was developed in a previous evaluation based on $^{234}U/^{238}U$ ratios. Samples with uranium concentrations below 10 µg/L have isotopic ratios that indicate a natural background source, whereas most samples with uranium concentrations above 10 µg/L have ratios that suggest a local contaminant source for the majority of the detected uranium. An additional 12 wells that were sampled four or more times are part of the monitoring network. Samples from these wells have on average less than 10 µg/L U and are not discussed here because they most likely represent background concentrations.

The 18 impacted wells were grouped for plotting purposes into four categories based on ranges of uranium concentrations so that the trends can be clearly seen on the trend plots. These categories are 10-15, 15-30, 30-90, and >90 µg/L U, which allows three to six wells per plot, as shown on Figures 1, 2, 3, and 4. Most of the wells were sampled four times during November 2007; September 2009; September 2010; and August 2011. Three of the 18 impacted wells that appear on Figure 4 were also sampled during February 2012, yielding five samples for those wells.

The U concentrations shown on the plots were calculated by converting the activities (as pCi/L) of each of the ^{234}U, ^{235}U, and ^{238}U isotopes to mass (as µg/L) based on their specific activity constants (as Ci/g) and summed. Analyses of filtered (0.45 micron) samples were used in the evaluation. Duplicate results were averaged together for plotting purposes. Figures 1 through 4 do not appear to show any consistent trends.

An additional perspective is provided in Figure 5, which shows mean U concentrations for each of the four sample events calculated from the 18 impacted wells. Error bars are set equal to plus and minus one standard deviation for each sample event. This plume-wide mean perspective shows that the standard deviations in U concentrations at each sample event are of the same magnitude as the mean concentrations at each sample event, and that the differences in means between events is much less than the standard deviations of the individual means. These results imply that any trend in the plume-wide averages, if present, would not be detectable over the four-year monitoring period.

Kendall-Tau Test of Trend

Kendall's tau, which is equivalent to the Mann-Kendall test, is used here as a trend estimator as recommended by the EPA. It compares repeated measurements of an analyte concentration over time, and tests the null hypothesis that the measurements exhibit no temporal trend. It is a nonparametric test, which means that it is based on the direction of change in concentration (up or down) over time rather than the magnitude of the change over time.

To perform the test, the *signs* (positive for increases, negative for decreases) of all possible pairs of data points are summed. For instance, if there are four sequential measurements (1, 2, 3, and 4), then the signs of 1 versus 2, 1 versus 3, 1 versus 4, 2 versus 3, 2 versus 4, and 3 versus 4 are summed. If there is no real trend, then the number of positive and negative signs will be roughly equal, although some differences would be expected due to chance. However, if there are many more increases than decreases between the pairs, then a real upward trend is indicated, and if there are many more decreases than increases between the pairs, then a real downward trend is indicated.

The test returns a *tau* coefficient that equals the sum of the signs divided by the total number of sample pairs available. If the concentrations consistently increase at each successive sample event, then *tau* equals +1, if the concentrations consistently decrease at each successive sample event, then *tau* equals –1, and if the number of positive and negative signs are equal, than *tau* equals zero. For all other arrangements *tau* lies between −1 and 1. The test was performed at a 95 percent confidence level, at which there is only a five percent chance of incorrectly accepting the null hypothesis (no trend is present) when a trend actually is present.

Trends at all 30 wells (impacted and unimpacted wells sampled four or more times) were tested. Test results are shown in Table 1. Only 3 of the 30 wells showed significant trends, which are highlighted in bold. MW-3 is a background well with a significant downward trend, and MW-603D is a background well with a significant upward trend. One impacted well, MW-24, had a significant upward trend with concentrations that increased from 5.49 to 35.08 µg/L in the four successive samples. For an increasing or decreasing trend to be considered statistically significant at a 95 percent confidence level with only four samples, the concentrations must increase or decrease sequentially at all four sample events. With four rounds, there are only [½ $n(n\text{-}1)$] = six pairs of samples that can be compared for an increase or decrease over time. Four random increases in a row can be expected just due to chance with a probability of 1/6. With 30 wells, this should occur on average about [30 x 1/6] = five times due to chance. These results indicate that no statistically significant trends in uranium concentrations are detectable over the four-year monitoring period, with the possible exceptions of MW-3, MW-603D, and MW-24. For the remaining wells, no statistically significant trends in uranium concentrations

are detectable over the four-year monitoring period. However, it should be noted that four samples obtained over a 4-year period may be insufficient to detect upward or downward trends in wells with shallow slopes.

APPENDIX A

Daily Reports and Field Notes

(Provided on CD)

U.S. Army Corps of Engineers

Buffalo District

12 May 2015

CONTRACTORS QUALITY CONTROL Report (QCR)	Report Number __2_ Page 1 of _2__
DAILY LOG OF CONSTRUCTION	Date 6/14/11
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: Calm, slight breeze 55-70, mist to sunny

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No – PM Karl Van Keuren discussed charging overtime with Nothnagle drilling for extended work days. Rate is $30/hr per person – will be used on an as needed basis – completing almost finished well, etc. to help production rate. Will not go over 2hr/day for HS concerns since drillers drive about 1 hour/day. No affect to USACE – Shaw cost management of project.
-

Activities In Progress:

- Cleared utilities with Allvac Maintenance Supervisor, air knifed in new locations at 701, 703, and 709, and set casing at 701DD.
- Did location recon at 705, 710,711, 712, and 713. All appear reachable other than 713. No good access point and large amount of clearing involved.
- PM will call in offsite dig locations after finalized (onsite already called in).

Were there any Delays in Work Progress today?

- Yes, Reg Buri was delayed from clearing 701DD by staff meetings.
- Drillers didn't have acetate liners for split spoons.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- none

Safety Inspection / Safety Meetings:
- Tailgate, AHA, JSA, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- Drill rig and other equipment surveyed for radiological contamination,

ACTIVITY STAR/FINISH
- Started drilling today.

QC REQUIREMENTS

- - Need undisturbed geotech samples for Oak Ridge Lab leaching studies for U to GW, contactor to macro-core stratigraphy in unconsolidated, then push split-spoon with liner where Shaw wants geotech sample.

QA/QC PUNCH LIST
-none

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
Start – 6/13/11
End - open

LABOR HOURS
Start 0700 - End 1700 (drillers and well installation)- no Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid for well footage. .

ACCIDENT REPORTING
none

Contractor Certification : On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

QC Representative's Signature and Date	Superintendent's Initials and Date

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: Calm, sunny 55-80 F

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:
- Soil sampling, setting and grouting 4" steel casings, begin bedrock coring.

Were there any Delays in Work Progress today?
- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately. Noise monitoring performed at rig during operations.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None

ACTIVITY START/FINISH
- Sample soil, set and grout casings at 706 DD and 709 DD. Begin bedrock coring at 701 DD during early PM.

QC REQUIREMENTS
- - None

QA/QC PUNCH LIST
-None

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
Start – 6/13/11
End – open

LABOR HOURS
Start 0700 - End 1630 (drillers and well installation)- no Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid for well footage. .

ACCIDENT REPORTING
None

Contractor Certification : On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

QC Representative's Signature and Date Kevin C. Cronin	Superintendent's Initials and Date

CONTRACTORS QUALITY CONTROL Report (QCR)	Report Number _061611__ Page 1 of _1__
DAILY LOG OF CONSTRUCTION	Date 06/16/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; sunny, 55-70, PM; becoming cloudy, rain showers after 1500.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:
- Utility clearance, continue/finish bedrock coring, set groundwater monitoring well.

Were there any Delays in Work Progress today?
- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None

ACTIVITY START/FINISH
- Clear utilities at 702 DD and 711 D, DD. Continue coring at 701 DD, finish in PM at ~80' BGL.
- Plug back 701 DD corehole with bentonite to ~41' BGL, set 2" PVC screen from ~30' – 40'. Well construction documented separately.

QC REQUIREMENTS
- -None

QA/QC PUNCH LIST
-None

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
Start – 6/13/11
End – open

LABOR HOURS
Start 0700 - End 1700 (drillers and well installation)- no Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid for well footage. .

ACCIDENT REPORTING
-None

Contractor Certification: On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

QC Representative's Signature and Date	Superintendent's Initials and Date

CONTRACTORS QUALITY CONTROL Report (QCR)	Report Number _061711__ Page 1 of _1__
DAILY LOG OF CONSTRUCTION	Date 06/17/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Mostly cloudy, slight breeze 65-70, PM; same, light showers

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
May have increased number of flush mounted roadboxes installed at Reg Buri's request due to plant traffic.

Activities In Progress:

- Began coring bedrock at 709 DD, suspended due to water coming back to surface; regrouted borehole with additional grout and will set over the weekend. Cleared 711 D, DD and began clearing 705 D, DD. Sampled soils at 704 DD and 707 DD and collected 3" splitspoon samples.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
-

DAILY LOG OF CONSTRUCTION	Date 06/20/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, slight breeze 65°-75° F, PM; Partly sunny, 80° F, breezy

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No.

Activities In Progress:

- Restarted coring bedrock at 709 DD (suspended due to water coming back to surface 06/17/11; regrouted) Cored from ~10' – 80' BGL. Plugged back with bentonite chips to ~48' BGL – will hydrate overnight and begin well install 6/21/11 am. Cleared 710 D, DD. UFPO called in by Karl V. for 705, 708, 710 & 711 locations.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – no USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, slight breeze 65°-75° F, PM; Mostly cloudy, 85° F, humid, breezy

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No.

Activities In Progress:

- Cut 4" casing at 709 DD and installed 2" PVC monitoring well at ~ 41' bgl (well construction diagram completed). Started coring bedrock to ~10' bgl at 707 DD but was suspended due to water coming back to surface. Regrouted from surface to ~10'bgl. Moved to 706 DD to begin coring there but coring also suspended due to water coming back to surface. Regrouted from surface to ~10'bgl. Moved to 706 DD and cored from ~8' – 38' bgl. Cleared 703 DD and located 708 DD and 710 D, DD locations on east side of Ohio Street.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – no USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, forklift awareness/procedures, hot work permit for 709 DD casing cut down, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)

CONTRACTORS QUALITY CONTROL Report (QCR)	Report Number _062211__ Page 1 of _1__
DAILY LOG OF CONSTRUCTION	Date 06/22/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Cloudy, rain showers, light breeze 65°-75° F, PM; Mostly cloudy, 85° F, humid, breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No.

Activities In Progress:

- Continued coring at 706 DD and cored from ~38' – 50' bgl (10' extra to look for deeper fracture zone). Plugged back to ~41' with bentonite and installed monitoring well – documented separately. Move drilling rig back to 704 DD to continue coring begun 6/21/11. Cored to ~40' bgl and set well from ~29'-39' bgl after consultation with K. Van Keuren and V. Tandon. Will complete 6/23/11 am. Premier Locating at Allvac in pm to locate utilities for offsite locations.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected, however rain fell in the morning.

Verbal Instructions given by Government:
- None – no USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, hot work permit for 704 DD casing cut down, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Mostly sunny, light breeze 65°-75° F, PM; Mostly cloudy, 85° F, humid, breezy, rain showers after 1510, thunderstorms

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
Began using 8" temporary casing and running 6" tricone roller bit to approximately 10' bgl to adequately seat and grout 4" permanent casing in boreholes.

Activities In Progress:

- Soil sampled (Macrocore® and 3" ssp samples for geotech analysis) and ran 8" temporary casing and set and grouted 4" permanent casings at 702 DD, 711DD and 711 D. Moved coreboxes back to decon pad area.

Were there any Delays in Work Progress today?

- No, PM thunderstorm arrived after casing work was completed at 1530.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – no USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, hot work permit for 702 DD, 711 D, DD casings, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Cloudy, showers/rain/thunderstorm, breezy 65°F, PM; Mostly cloudy, 70° F, humid, breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Drilled out grout from 4" casing at 702 DD and cored from 10' – 40' bgl. Installed 702 DD groundwater monitoring well (documented separately). Moved 702 DD coreboxes back to decon pad area. Cleared utilities at 708 DD and 710 D, DD.

Were there any Delays in Work Progress today?

- Yes; AM thunderstorm/heavy rain arrived after 0845 –lost ~45 minutes waiting for storms to pass.

General Comments:
- No elevated radiological readings detected however rain event during work.

Verbal Instructions given by Government:
- None – no USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

CONTRACTORS QUALITY CONTROL Report (QCR) DAILY LOG OF CONSTRUCTION	Report Number _062711__ Page 1 of _1__ Date 06/27/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, light breeze 65°-75° F, PM; Sunny, 80° F, breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Soil sampled (Macrocore® and 3" ssp sample for geotechnical analysis) and ran 8" temporary casing and set and grouted 4" permanent casing at 708 DD. Collected Macrocore® soil samples and ran 8" temporary casing and set and grouted 4" permanent casings at 710D and 710 DD. Moved back to 707 DD to resume coring but had water leaking out around 4" casing again. Pulled 4" casing, drove 8" temporary casing and rollerbit (6") to ~10' bgl and grouted after installing ~11' length of 4" casing into borehole. Work on well completion at 702 DD location. (Driller has to leave early today for doctor's appt.).

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – Mark , Jeff Hall and Bill Fredricks (USACE personnel) onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, hot work permit for 708 DD, 710 D, DD casings, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

DAILY LOG OF CONSTRUCTION	Date 06/28/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Cloudy, breezy 65°-75° F, PM; Mostly sunny, 85° F, humid, windy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
Flush mounted protective casing requested for well 708 DD instead of stickup casing. Possible that some restoration work will be needed on rutted lawn leading into 707 DD location (multiple moves on and off location due to leaking surface casing work).

Activities In Progress:

- Completed coring at 708 DD, cored from ~5' – 40' bgl and installed monitoring well – documented separately. Move CME 85 drilling rig back to 707 DD to continue coring begun 6/21/11. Cored to ~30' bgl. Will complete coring and well installation 6/29/11 am. Nothnagle brought CME 55LC ATV rig onsite this am, moved to 705 D, DD location.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – USACE personnel (Mark Legeza) onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, hot work permit for 708 DD casing cut down, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

DAILY LOG OF CONSTRUCTION	Date 06/30/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, calm 65° F, PM; Sunny, 80° F, breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Completed coring at 710 DD, cored from ~32' – 42' bgl and installed monitoring well – documented separately. Moved CME 85 to 703 DD location and soil sampled (Macrocore & 3" ssp) and set and grouted 4" casing to ~5' bgl. Utilized CME 55LC ATV rig to begin coring at 705 DD location but after 1st run (from ~5' – 10' bgl) in weathered bedrock 4" casing was leaking. Regrouted that casing (now called 705 D) and moved to other 4" casing (now called 705 DD) and cored bedrock from ~10' – 40' and installed monitoring well – documented separately.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – USACE personnel (Mark Legeza) onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, hot work permit for 703 DD casing cut down, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, calm 70° F, PM; Sunny, 80° F, calm.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Resumed coring with CME 55LC at 705 D; cored from ~10' – 20' bgl and installed monitoring well – documented separately. Moved ATV rig to 703 DD location for the holiday weekend. Moved CME 85 rig to begin coring at 710 D location and cored bedrock from ~7' – 20' and installed monitoring well – documented separately.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies. Air sampling performed at 710 D location only as the generator's pull cord broke when starting sampling at 705 D in am. Hertz onsite at 1130 to replace pull cord. Sampling begun thereafter.

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, breezy 70° F. PM; Mostly sunny, 80° F, breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Continued well development. Developed 702 DD (drying out), 711 D and DD (both drying out) and 705 D and DD (both drying out). Well 707 DD hadn't recharged much overnight and groundwater elevation changed only ~0.12 foot. These locations will be revisited 07/14/11.Trent Richards completed release surveys on two high-vol air samplers which will be returned to Shaw's Findlay, Ohio shop.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – USACE personnel (Mark Legeza) onsite today.

Safety Inspection / Safety Meetings:
- Daily Tailgate/Safety Meeting/ Training Log; documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Safety and radiological clearance, no deficiencies. Began bi-monthly Project Safety Inspection Report. Additional supplies ordered for office trailer.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None

ACTIVITY START/FINISH
- Well development began 07/06/11.

QC REQUIREMENTS
- None

QA/QC PUNCH LIST
-None

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
Start – 06/13/11
End - open

LABOR HOURS
Start 0700 - End 1430 (drillers) - no Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid for well footage.

ACCIDENT REPORTING
None

Contractor Certification: On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, calm 70° F. PM; Sunny, 85° F, somewhat breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Continued well development. Developed 702 DD (drying out), 711 D and DD (both drying out) and 705 D and DD (both drying out). Well 707 DD hadn't recharged much overnight and groundwater elevation changed only ~0.04 foot from July 13, 2011am. These locations will be revisited 07/15/11. Attempted to locate 712 and 713 well locations on NYS Erie Canal parcel – looks improbable to clear/locate suitable drilling locations due to surface conditions (boulders, excavated rock piles and berms, steep slopes, narrow property dimensions).

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – USACE personnel (Mark Legeza) onsite today.

Safety Inspection / Safety Meetings:
- Daily Tailgate/Safety Meeting/ Training Log; documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Safety and radiological clearance, no deficiencies. Completed bi-monthly Project Safety Inspection Report. Fire extinguisher purchased and installed in office trailer.

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, breezy 70° F., PM; Mostly sunny, 87° F, humid, somewhat breezy.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Met with Rolando Moreno, CE (City of Lockport Eng. Dept.) to determine locations of Sewer Sampling points. City personnel haven't been able to locate sample Location #2 in years (paved over?). Used metal detector to locate possible location in middle of Ohio St. Direction will be needed on how to proceed with this sample location.
- Restaked 712 and 713 locations to avoid property lines as per latest GPS location map received by Trent Richards. UFPO request will be made when locations are approved by the USACE.
- Trent Richards traveled to Nothnagle Drilling to perform additional scans requested by Jim Langsted on the 250-gallon poly tank that was cleaned out and radiologically scanned for release on July 15, 2011. Documented separately.
- Contacted TestAmerica to process sample bottle order and begin receiving bottles/coolers at the site.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Daily Tailgate/Safety Meeting/ Training Log; documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, calm, humid 75° F., PM; Sunny, calm, humid, 93° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- Richards/Cronin attended Shaw/USACE Guterl PDT Bi-weekly Status Call in AM.
- Investigated Sanitary Sewer line (15") that crosses undeveloped Newfane Lumber parcel for upcoming sampling. Spoke with Paul Henning (?) – owner, who located southwest manhole. Northeast sewer manhole is under Newfane Lumber parking lot pavement. City of Lockport Engineering Department (Rolando Moreno) was contacted to get sewer construction specifics; awaiting callback. Spoke with Norm Baker regarding water lines.
- Called Nothnagle Drilling regarding remobe to site for 712D, DD and 713D drilling, awaiting callback with date.
- First shipment of sample bottles (6 boxes) and coolers (23) received from TestAmerica, more expected next week. All brought on site.

Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Cloudy, calm, occasional rain showers and thunderstorms, humid 70° F., PM; Mostly sunny, breezy, humid, 83° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
No

Activities In Progress:

- City of Lockport Engineering Department (Rolando Moreno) was contacted to coordinate sewer sampling with City personnel. Sampling scheduled for Wednesday July 27, 2011 at 1330. Four gas meter ordered from Pine Environmental.
- Reviewed Nothnagle Drilling invoice for tasks completed to date.
- Inventoried shipment of sample bottles and coolers received from TestAmerica. Determined bottle needs for sewer sampling task later this week. Ordered sixty 45 µm in-line filters for upcoming groundwater sampling task. Verified that no QC samples are required to be collected during this task.

Were there any Delays in Work Progress today?

No

Activities In Progress:

- Nothnagle Drilling finishes well installation at 712 DD then cores bedrock from ~5' to 20' bgl at 712 D and installs 2" PVC well – documented separately. Well pads installed at 712 D, 712 DD and 713 D. All wells (17) have now been installed.
- Begin/complete development at 713 D – documented separately.
- Begin/complete development at 712 DD – documented separately.
- Sewer sample locations #1 and #2 were shipped off today to TestAmerica St. Louis via TestAmerica courier.

Were there any Delays in Work Progress today?

- No

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate, rig inspection, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Rig safety and radiological clearance, no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Cloudy, breezy, 72° F. PM; Mostly cloudy becoming partly sunny, breezy, humid, 76° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Continued groundwater sampling task. Collected samples at MW-706 DD, MW-710 D, and MW-711 DD – documented separately. Could not fill full bottle set at MW-711 DD due to slow recharge at depth. Will continue to collect groundwater at that location tomorrow. Samples handed off to TestAmerica Buffalo courier in PM for Tuesday delivery to TestAmerica St. Louis.
- Set up Grunfos Redi-Flo 2 submersible pump at MW-710 DD but keep getting 'ground fault' message at controller unit. Consult with Pine Environmental – likely an electrical short in the pump cable. Replacement pump unit being delivered 08/16 am to the Lockport Comfort Inn.

Were there any Delays in Work Progress today?
-Yes, issues with the Grunfos submersible pump.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Clear, slightly breezy, 69° F. PM; Sunny, slightly breezy, 84° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Continued groundwater sampling task. Attempted to use replacement Grunfos pump but had problem with Hertz generator's GFCI tripping repeatedly. Called Pine Environmental (Mattydale, NY and New Jersey offices) to discuss problem. They suggest using a different generator as voltage range produced might be too much for controller. Drive to Hertz to try another generator with pump but it too trips GFCI. Consult with Karl V. Make arrangements with Pine to meet in Rochester, NY area to get Honda generator from them and to test pump(s). Drive to and from Victor, NY to get a new controller and Honda EU 2000i generator.
- Purged MW-707 DD using disposable bailer to collect ~ 6' of groundwater. Well dried out. Will check Thursday to see if any groundwater can be sampled. No samples collected today so noTestAmerica Buffalo courier needed.
- Cut/cleared vegetation to create a path to MW-600 cluster along northern site boundary.

Were there any Delays in Work Progress today?
- Grunfos pump/controller issues, replacement.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Radiological clearance, no deficiencies.

PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site		Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Mostly cloudy, calm, 67° F. PM; Partly sunny, breezy, 78° F.	

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Continued hydraulic conductivity testing at MW-710 D (Solid PVC slug; falling and rising head tests) along with MW-710 DD offset testing, and at MW-709 DD (Pneumatic slug assembly; rising test) along with MW-604 D offset testing, Set up to perform testing, at MW-706 DD (Pneumatic slug assembly) along with MW-19 offset testing, but found we could not build up pressure in MW-706 DD. Found sand from the annular space between 4" protective casing and 2" PVC riser pipe was being blown out the casing's weep hole, suggesting either a split in the riser pipe or a loose joint. Riser connections appear to be tight. A Solid PVC slug test will be run on this well next Monday.
- Received groundwater sampling filters from Pine Environmental for future sampling events.

Were there any Delays in Work Progress today?
- None.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Radiological clearance, no deficiencies.

CONTRACTORS QUALITY CONTROL REPORT (CQCR) DAILY LOG OF CONSTRUCTION	Report Number _083011__ Page 1 of _1__ Date 08/30/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, breezy, 66° F. PM; Mostly sunny, breezy, 78° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Continued hydraulic conductivity testing at MW-703 DD (Pneumatic slug assembly; rising head tests) along with MW-607 D offset testing, at MW-701 DD (Pneumatic slug assembly; rising head tests), at MW-702 DD along with MW-602 D offset testing, and at MW-704 DD (Pneumatic slug assembly; rising head tests) along with MW - 605 D offset testing. Hydraulic conductivity testing is completed.
- Ordered non-aqueous IDW bottle set from TestAmerica Buffalo, will pick up in late PM.

Were there any Delays in Work Progress today?
- None.

General Comments:
- No radiological readings taken; just source checks performed.

Verbal Instructions given by Government:
- None – USACE (Mark Legeza) personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- No deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None.

ACTIVITY START/FINISH
- Hydraulic Conductivity testing begun 08/24/2011, finished 08/30/2011.

QC REQUIREMENTS
- None.

QA/QC PUNCH LIST
- None.

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
- None.

LABOR HOURS
-No Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid.

ACCIDENT REPORTING
- None.

Contractor Certification: On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

QC Representative's Signature and Date	Superintendent's Initials and Date

CONTRACTORS QUALITY CONTROL REPORT (CQCR) DAILY LOG OF CONSTRUCTION	Report Number _083111__ Page 1 of _1__ Date 08/31/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Sunny, breezy, 65° F. PM; Mostly sunny, breezy, 82° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Collected aqueous and non-aqueous IDW samples from drummed waste for disposal analysis.
- Collected final groundwater samples (filtered Total Uranium, filtered and unfiltered TAL metals) from MW-707 DD. Samples handed off to TestAmerica Buffalo courier in late PM for Thursday delivery to TestAmerica St. Louis. Sent empty coolers and unused bottles back to TestAmerica.
- Performed out-of-scope hydraulic conductivity testing at MW-705 D and MW-705 DD (solid PVC slug testing), only performed falling head tests due to the extremely slow recharge rate observed at both wells. Test ended at MW-705 DD due to Troll running out of memory. Plan to perform falling head tests at MW-702 DD and MW -711 DD as time allows.

Were there any Delays in Work Progress today?
- None.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – USACE (Mark Legeza) personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Radiological clearance; no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None.

ACTIVITY START/FINISH
- Hydraulic Conductivity testing begun 08/24/2011, finished 08/30/2011. Out-of-scope K testing started 08/31/2011.

QC REQUIREMENTS
- None.

QA/QC PUNCH LIST
- None.

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)

CONTRACTORS QUALITY CONTROL REPORT (CQCR) DAILY LOG OF CONSTRUCTION	Report Number _090111__ Page 1 of _1__ Date 09/01/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Mostly cloudy becoming mostly sunny, breezy, 68° F. PM; Mostly sunny, breezy, humid, 82° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Performed out-of-scope hydraulic conductivity testing at MW-702 DD and MW-711 DD (solid PVC slug testing), only performed falling head tests due to the extremely slow recharge rate observed at both wells.
- Began emptying office trailer and moving remaining materials and supplies to adjacent old Guard House for future site activities. Drive material to Tonawanda office and return to site with remaining tyvek to store onsite.
- Performed radiological release surveys on peristaltic pump, PID, and hydraulic conductivity equipment for return to Electronics Shop. Filled out dispatch forms and returned equipment to Findlay, Ohio office via UPS.

Were there any Delays in Work Progress today?
- None.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately. Completed Project Safety Inspection Report, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Radiological clearance; no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None.

GO THROUGH NW GATE TO GET TO 600 CLUSTER, PURGE + SAMPLE MW600D @ 0900 (A05BMW600D0001) MW 600S IS DRY. TALK W/ KVK + ED SHOCK RE: HYD. TESTING. MAKE UP MS/MSD LABELS FOR MW-5. GO TO MW-5 TO PURGE + SAMPLE (A02MW50001, MS, MSD) SAMPLE @ 1105. GO BACK TO TRAILER FOR TR TO COUNT - KC PURGES + SAMPLES MW-12 (A02MW120001) @ 1230. GO TO MW-03 TO PURGE AND SAMPLE @ 1345 (A02MW030001)

- 712 DD ?
- 710 D
- 713 D - SOLID SLUG

711 D

8/23 FILTERS DELIVERED

(23)

TUES 8/23 SUNNY 66°

pH: 7.00, 10.00

ONSITE @ 0650, CALIBRATE YSI (DO: 99.2%, NTUs: 0.0, 125.9) PID ARRIVED FROM FINDLAY CALIBRATED. GET EQUIPMENT TOGETHER GO TO MW-1 TO PURGE AND SAMPLE, START @ 0835 SAMPLE @ (A02MW01 0001) 0850. MOVE TO MW-2 (LAST WELL!) TO PURGE + SAMPLE (A02 MW02 0001 AND DUPLICATE A02MW 9005) @ 0930. SMEAR SAMPLES. GAS UP PINE GENERATOR AND DRIVE IT W/ GRUNFOS. TO TYCO ROCHESTER FOR J. MOYER TO DRIVE BACK TO PINE ON WAY HOME. DRIVE BACK TO SITE (EARTHQUAKE @ 1351, 5.8 VA) COLLECT ~ 700 ml FROM 707 DD FOR UNFILTERED TOTAL U. SHIP SAMPLES.

8/25 0953

MW-713 D @ 12.20'

0.4 PMW @ 12.20'

713 DD TEST IS REALLY 708 DD TEST

WED 8/24 SET UP FOR K TESTING W/ PNEUMATIC SLUG (PS) @ MW-710 CLUSTER; COULD ONLY DO 710 DD AS I BELOW TOS IN 710 D (NEED TO DO SOLID SLUG (SS) TEST) HAD TO CONFIGURE 2" PVC EXTENSION DUE TO TOO LITTLE ANNULAR SPACE BTWN 4" CASING & 2" PVC TO TIGHTEN CLAMP. WORK ON GETTING RUGGED READER RECORDING

THURS 8/25 CALIBRATE PID (0.0, 100 ppmv) DO K TESTING @ MW-708 DD (PS - K TESTING), MW-713 D (SS - K TESTING) AND MW-712 DD (PS - K TESTING), 712 D STILL DRY.

FRIDAY 8/26 CALIBRATE PID (0.0, 100 ppmv) DO K TESTING @ MW-710 D W/ SOLID PVC SLUG W/ TRANSDUCER IN 710 DD DURING TESTS

7.55'

0, 100 ppmv

MONDAY 8/29/11
AM CLEAR 60° PM SUNNY/BREEZY 75

ONSITE @ 0650 CALIBRATE PID, DO TAILGATE MTG. GO OUT TO MW 706 DD (MW-15 OFFSET TEST RUN) TO PERFORM SOLID SLUG TEST. RUN 3+ SETS OF RISING/FALLING. GO TO MW-711 CLUSTER PERFORM 3 SETS OF " " TESTS (VERY QUICK RECOVERIES) @ MW-711 D w/ MW-711DD OFFSET TESTING GOING ON CONCURRENTLY. SET UP PS ASSEMBLY @ MW 711 DD - GO TO TRAILER TO CHARGE RUGGED READER. COME BACK TO MW 711DD, PERFORM 3 PS TESTS (VERY FAST RECOVERY). MOVE TO 705 CLUSTER @ 1445. SET UP MW 705 DD OFFSET TEST THEN PERFORM MW 705D PS TESTS(4). SET UP MW 705 D OFFSET TEST (START @ 1602) THEN PERFORM MW 705 DD PS TESTS(4), END TESTS @ 1630

TUESDAY 8/30/11
AM SUNNY, 68°, BREEZY
PM

ON SITE @ 0655, CALIBRATE PID (0.0, 100.0 ppmv) GOT TO MW 703/607 CLUSTER; SET UP 607 D OFFSET TEST, 703 DD PS TEST. OFF TO MW 701 DD @ 0905; START TESTING (PS) @ 0930. ORDER NON-AQ IDW SAMPLE BOTTLES FROM TA (C. FOX) END MW 701 DD TESTING @ 1005. MOVE TO MW 702 DD/602 D, PULL TUBING AFTER MEASURING ▽ @ ~ 9.00' BTOC @ 702 DD, VERY SLOW RECHARGE. ATTEND TEAM CONF. CALL @ 1100, ▽ @ 1125 @ 702 DD: -9.82' BTOC, INSERT TROLL FINISH UP TESTS, MOVE TO MW 704 DD AT 1525. FINISH

WED 8/31
AM

ONSITE @ 0700 CALIBRATE PID (0.0, 100.0 ppmv). HAVE CONF CALL @ 0730 w/ VIKAST RE SLUG TESTING. GO TO DRUM AREA AND SAMPLE 7 DRUMS OF DEVELOPMENT/PURGE WATER FOR IDW ANALYSIS; SAMPLE @ 0930, SAMPLE SOIL/ROCK CUTTINGS FROM 4 DRUMS FOR NON-AQUEOUS IDW ANALYSIS @ 1020 GO TO 705 CLUSTER TO DO SOLID SLUG TESTING AS PER VT. GO TO MW 707 DD TO SAMPLE (PID; 0.1, ▽ @ 38.21')

CONTRACTORS QUALITY CONTROL REPORT (CQCR) DAILY LOG OF CONSTRUCTION	Report Number _090211__ Page 1 of _1__ Date 09/02/2011
PROJECT: Data Gap Investigation, Former Guterl Steel FUSRAP Site	Contract W912QR-08-D-0013 DO DN03
Contractor: Shaw Environmental & Infrastructure, Inc.	Weather: AM; Mostly sunny, breezy, humid, 68° F. PM; Mostly sunny, breezy, humid, 82° F.

QC NARRATIVES

Did anything develop that may lead to a Change Order/Claim?
- No.

Activities In Progress:

- Cronin/Richards attend bi-weekly PDT telecon.
- Finished emptying office trailer and moving remaining materials and supplies to adjacent old Guard House for future site activities. Ferguson Electric onsite at 0830 to disconnect electrical service; ask him to wait ~1/2 hour so Trent Richards can finish counting release smears. Drive material to Tonawanda office and return to site after returning pickup truck to Hertz.
- Performed radiological release surveys on rental truck and office trailer (interior and exterior), and equipment for return to Electronics Shop. Filled out dispatch forms and returned equipment to Findlay, Ohio office via UPS.
- Site keys returned to USACE personnel (M. Legeza) at guard house.

Were there any Delays in Work Progress today?
- None.

General Comments:
- No elevated radiological readings detected.

Verbal Instructions given by Government:
- None – No USACE personnel onsite today.

Safety Inspection / Safety Meetings:
- Tailgate meeting, documented separately.

Safety: (Inspections Made, Deficiencies noted):
- Radiological clearance; no deficiencies.

PREP/INITIAL DATES (Preparatory and initial meetings held or advance notice)
- None.

ACTIVITY START/FINISH
- Completed demobe activities 08/31/2011, finished 09/02/2011.

QC REQUIREMENTS
- None.

QA/QC PUNCH LIST
- None.

CONTRACTORS ON SITE (Report subcontractor's first and last day on site)
- None.

LABOR HOURS
-No Shaw hourly.

EQUIPMENT HOURS
Equipment hours included in bid.

ACCIDENT REPORTING
- None.

Contractor Certification: On behalf of the contractor, I certify that this Report is complete and correct and all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications, to the best of my knowledge, except as noted above.

QC Representative's Signature and Date	Superintendent's Initials and Date

Well Volume: 1.6 gal/Vol	

Well Volume Removed	Temp	pH	Conductivity	DO mg/L	ORP/Eh	Turbidity
Initial Reading	13.80	7.22	1.180	1.28	213.0	165.4
1327 ~ 3 GAL	12.68	7.20	1.153	0.30	118.0	50.8
1330 ~ 5 GAL	12.26	7.11	1.135	0.27	-86.6	99.0
1332 ~ 7 GAL	12.12	7.09	1.143	0.20	-110.3	93.3
1335 ~ 10 GAL	12.03	7.08	1.162	0.20	-133.6	54.9
1338 ~13 GAL	12.11	7.09	1.156	0.23	-141.8	62.2
1340 ~ 15 GAL	12.18	7.07	1.191	0.70	-144.4	62.3
1343 ~ 18 GAL	12.29	7.06	1.193	0.79	-153.0	101.3
1346 ~ 21 GAL	12.30	7.05	1.205	0.79	-157.3	18.0
1350 ~ 24 GAL	12.29	7.06	1.223	0.76	-163.9	95.9
1354 ~ 27 GAL	12.21	7.06	1.234	0.77	-167.7	9.7
1358 ~ 30 GAL	12.41	7.07	1.244	0.78	-172.8	24.3

Comments: GOOD RECOVERY WHEN PUMPING ENDED

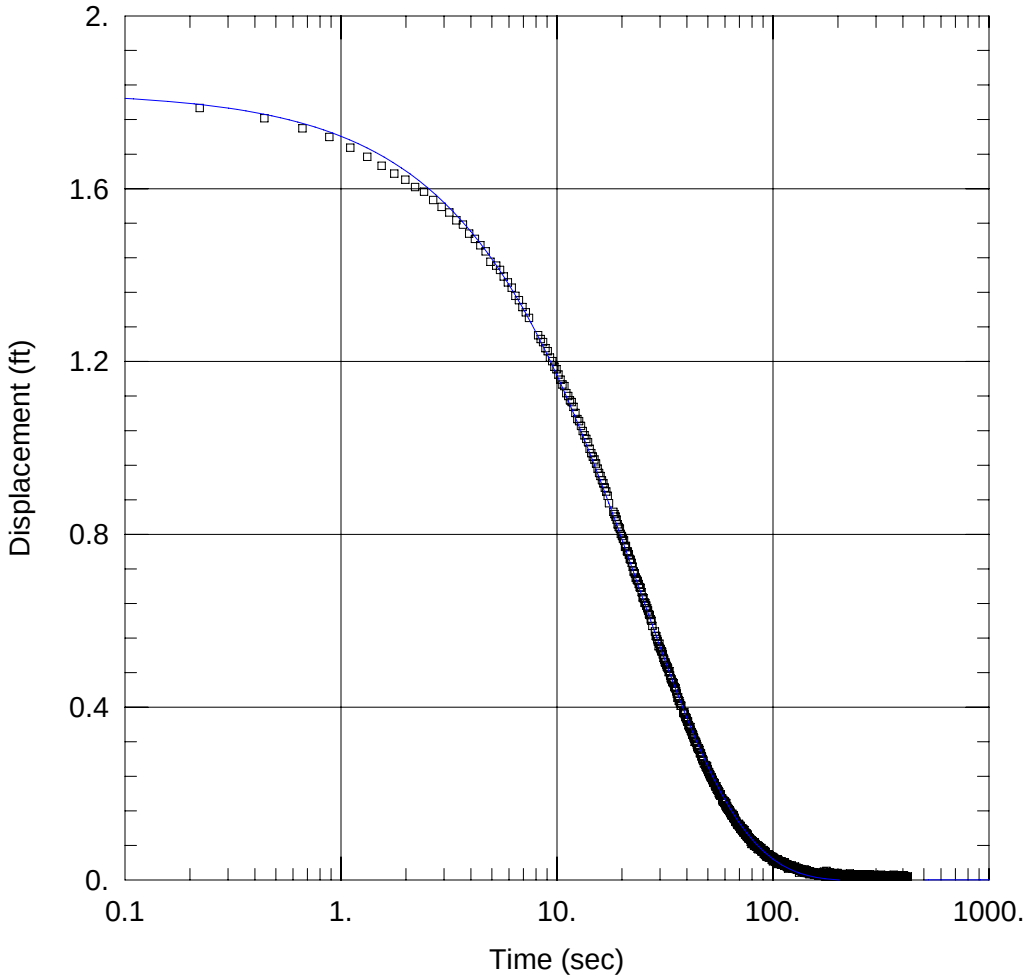
Prepared by: KEVIN CRONIN

Signature/Date: Kevin Cronin 8/1/2011

10" Diameter = 1.68 gal/ft
6" Diameter = 1.5 gal/ft
4" Diameter = 0.67 gal/ft
2" Diameter = 0.17 gal/ft
1.5" Diameter = 0.092 gal/ft

APPENDIX E

Slug Test Data Plots
(Provided on Same CD as Appendix A)



MW-701DD TEST 1 (PNEUMATIC SLUG TEST)

Data Set: C:\...\MW701DD Test 1.aqt
Date: 10/26/11 Time: 21:00:26

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-701DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 31.04 ft

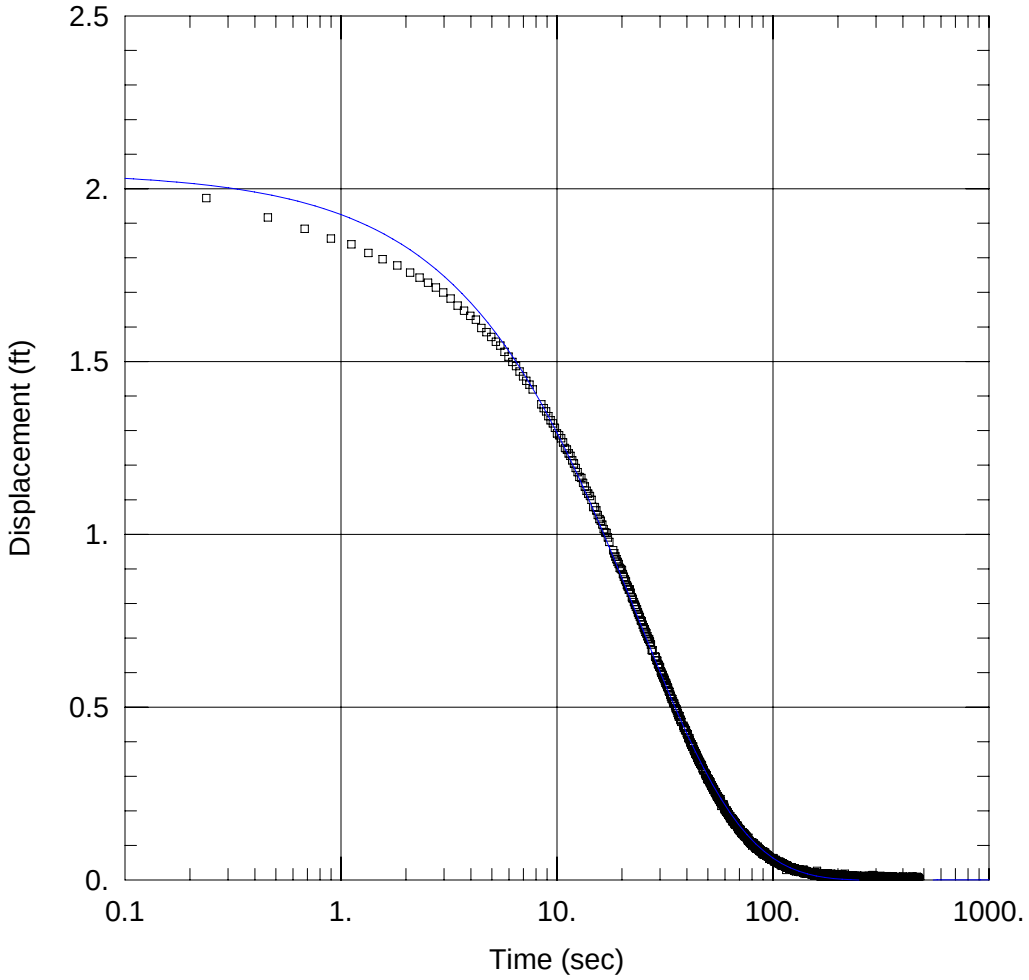
WELL DATA (MW701DD)

Initial Displacement: 1.825 ft
Total Well Penetration Depth: 31.04 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 31.04 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 5.154 ft/day
Kz/Kr = 1.
Ss = 5.058E-6 ft^{-1}



MW-701DD TEST 2 (PNEUMATIC SLUG TEST)

Data Set: C:\...\MW701DD Test 2.aqt
Date: 10/24/11 Time: 13:42:18

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-701DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 31.04 ft

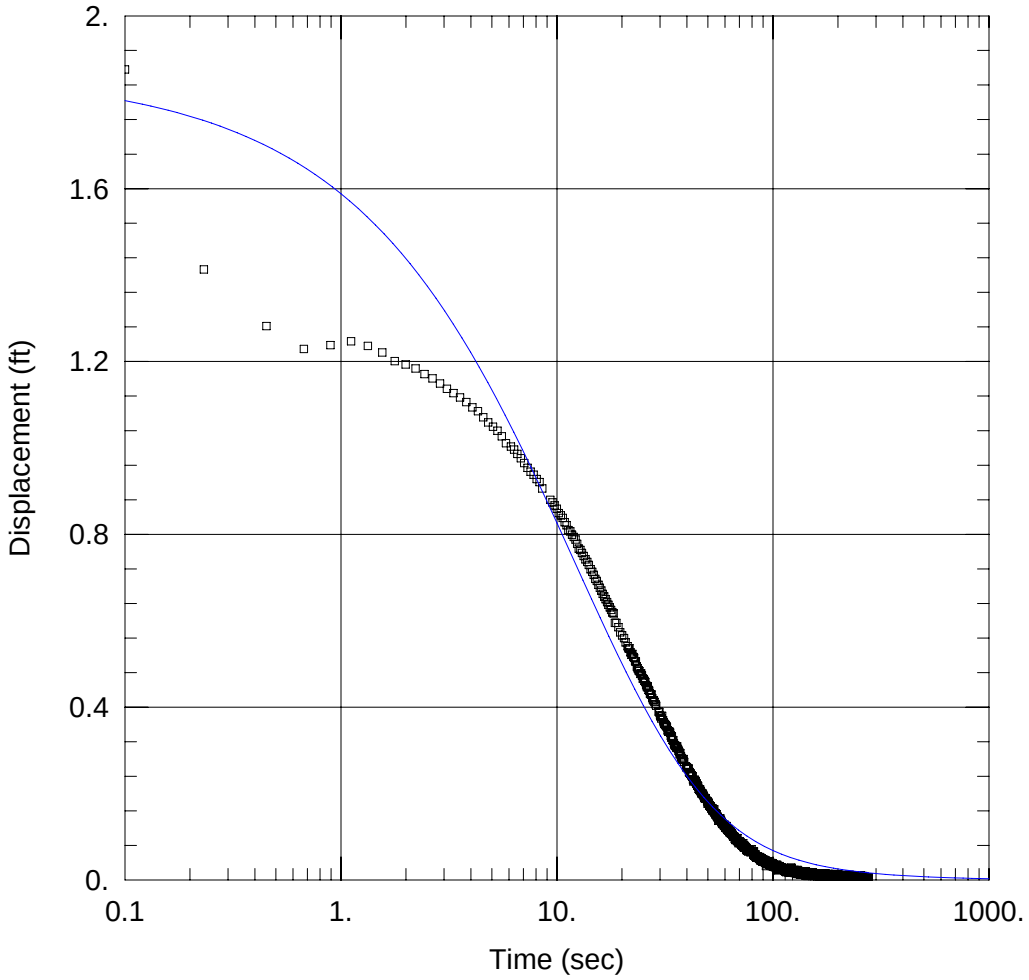
WELL DATA (MW-701DD)

Initial Displacement: 2.05 ft
Total Well Penetration Depth: 31.04 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 31.04 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 5.072 ft/day
Kz/Kr = 1.
Ss = 9.063E-6 ft^{-1}



MW-701DD TEST 3 (PNEUMATIC SLUG TEST)

Data Set: C:\...\MW701DD Test 3.aqt
Date: 10/26/11 Time: 21:01:36

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-701DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 31.04 ft

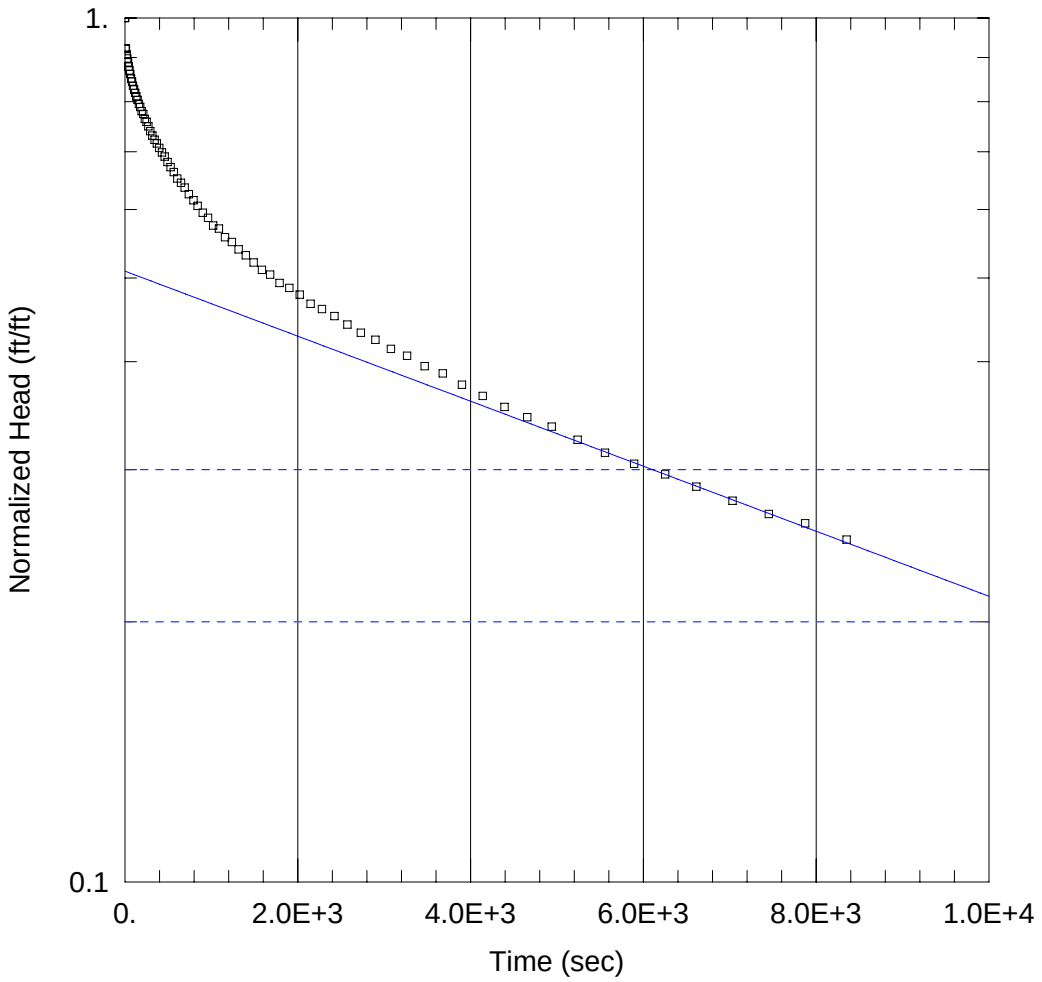
WELL DATA (MW-701DD)

Initial Displacement: 1.876 ft
Total Well Penetration Depth: 31.04 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 31.04 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 5.208 ft/day
Kz/Kr = 1.
Ss = 0.0006235 ft^{-1}



MW-702DD SS FH TEST EXTRA_BOUWER RICE

Data Set: C:\...\MW702DD SS FH Test Extra_BR.aqt
Date: 10/24/11 Time: 15:00:34

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-702DD
Test Date: 09-01-11

AQUIFER DATA

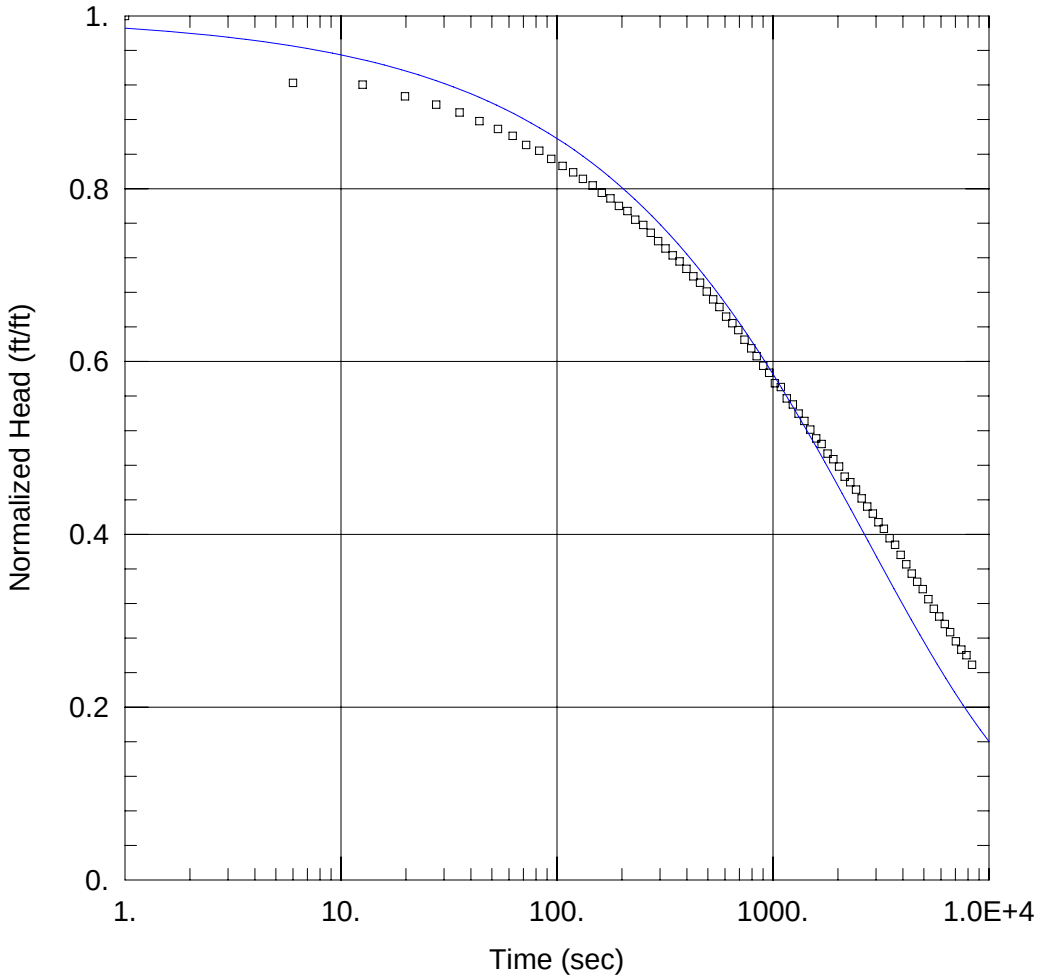
Saturated Thickness: 33.1 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-702DD)

Initial Displacement: 1.988 ft Static Water Column Height: 33.1 ft
Total Well Penetration Depth: 33.1 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.0102 ft/day y0 = 1.012 ft



MW-702DD SS FH TEST EXTRA

Data Set: C:\...\MW702DD SS FH Test Extra.aqt
Date: 10/24/11 Time: 14:53:20

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-702DD
Test Date: 09-01-11

AQUIFER DATA

Saturated Thickness: 33.1 ft

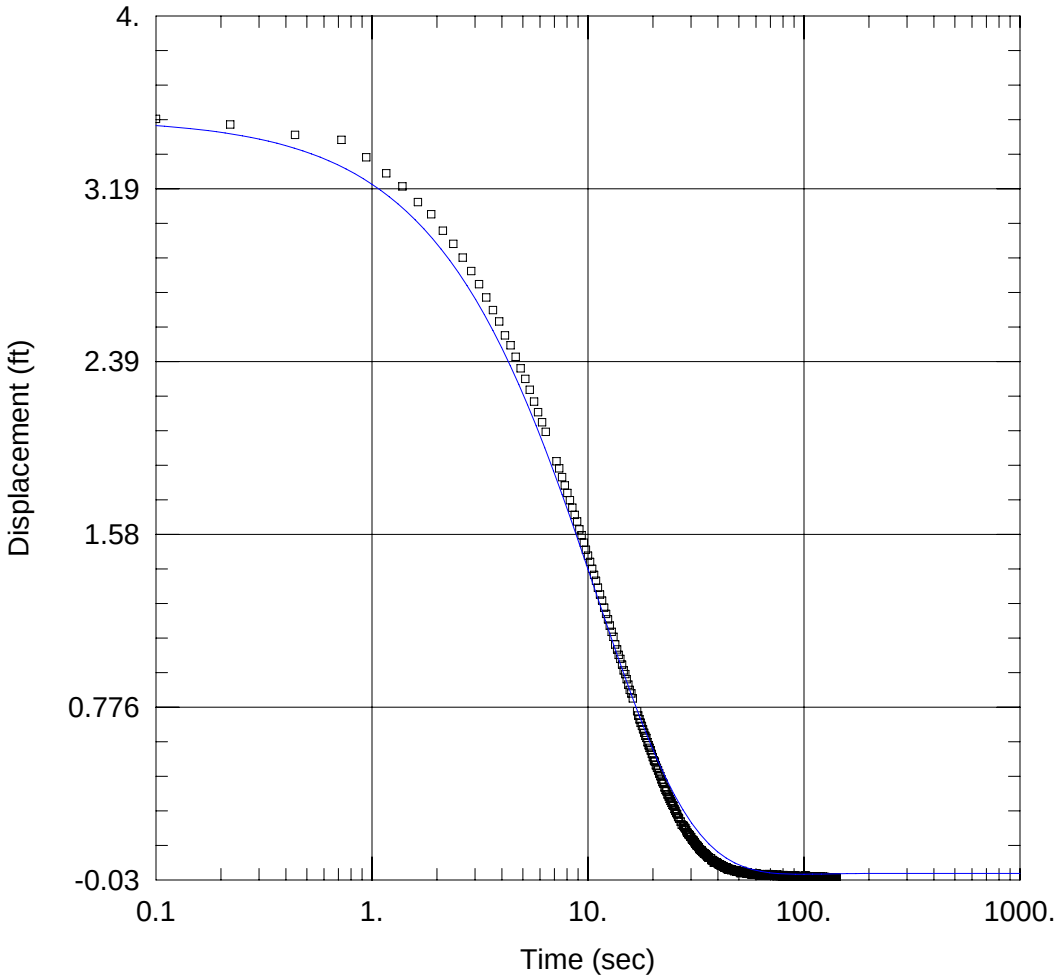
WELL DATA (MW-702DD)

Initial Displacement: 1.988 ft
Total Well Penetration Depth: 33.1 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 33.1 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 0.01086 ft/day
Kz/Kr = 1.
Ss = 0.006045 ft^{-1}



MW-703DD PNEUMATIC SLUG TEST 1

Data Set: C:\...\MW703DD PS Test1.aqt
Date: 10/24/11 Time: 21:01:27

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-703DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 17.11 ft

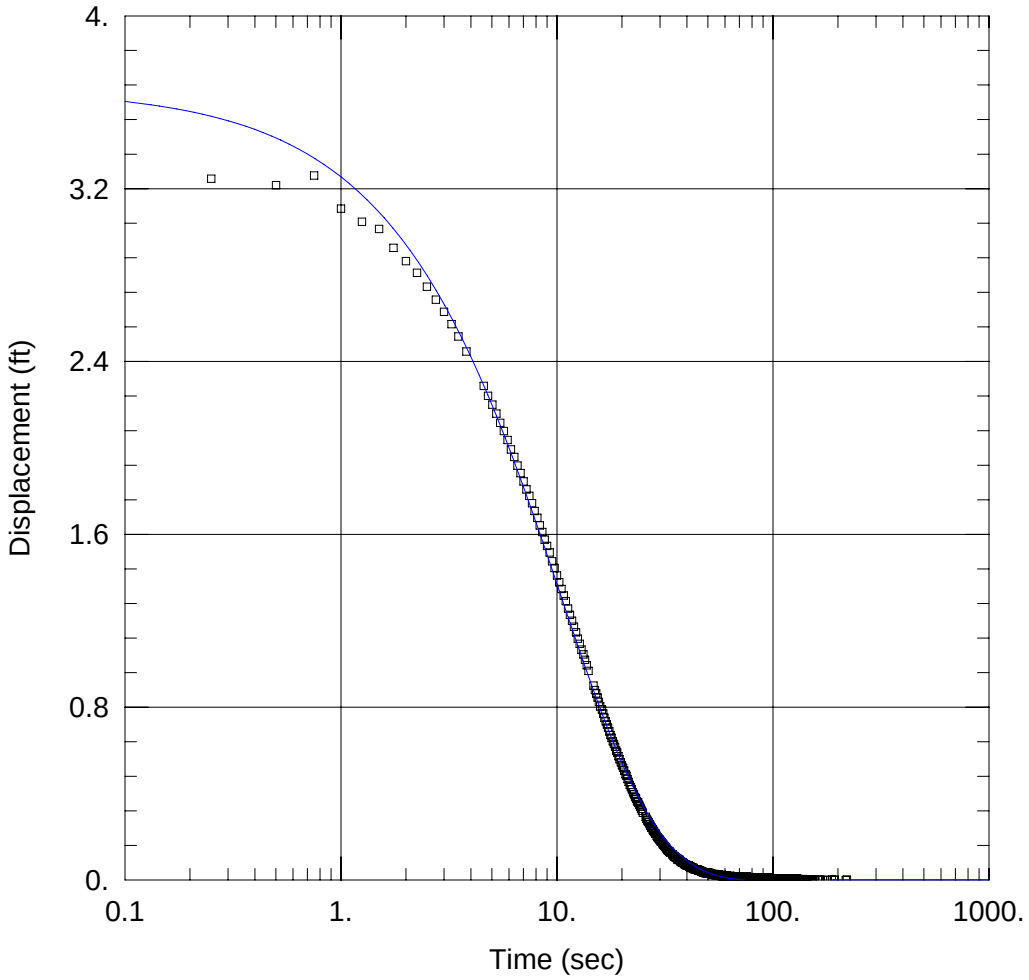
WELL DATA (MW703-DD)

Initial Displacement: 3.52 ft
Total Well Penetration Depth: 17.11 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 17.11 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 11.18 ft/day
Kz/Kr = 1.
Ss = 3.151E-12 ft^{-1}



MW-703DD PNEUMATIC SLUG TEST 2

Data Set: C:\...\MW703DD PS Test2.aqt
Date: 10/24/11 Time: 21:23:25

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-703DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 17.11 ft

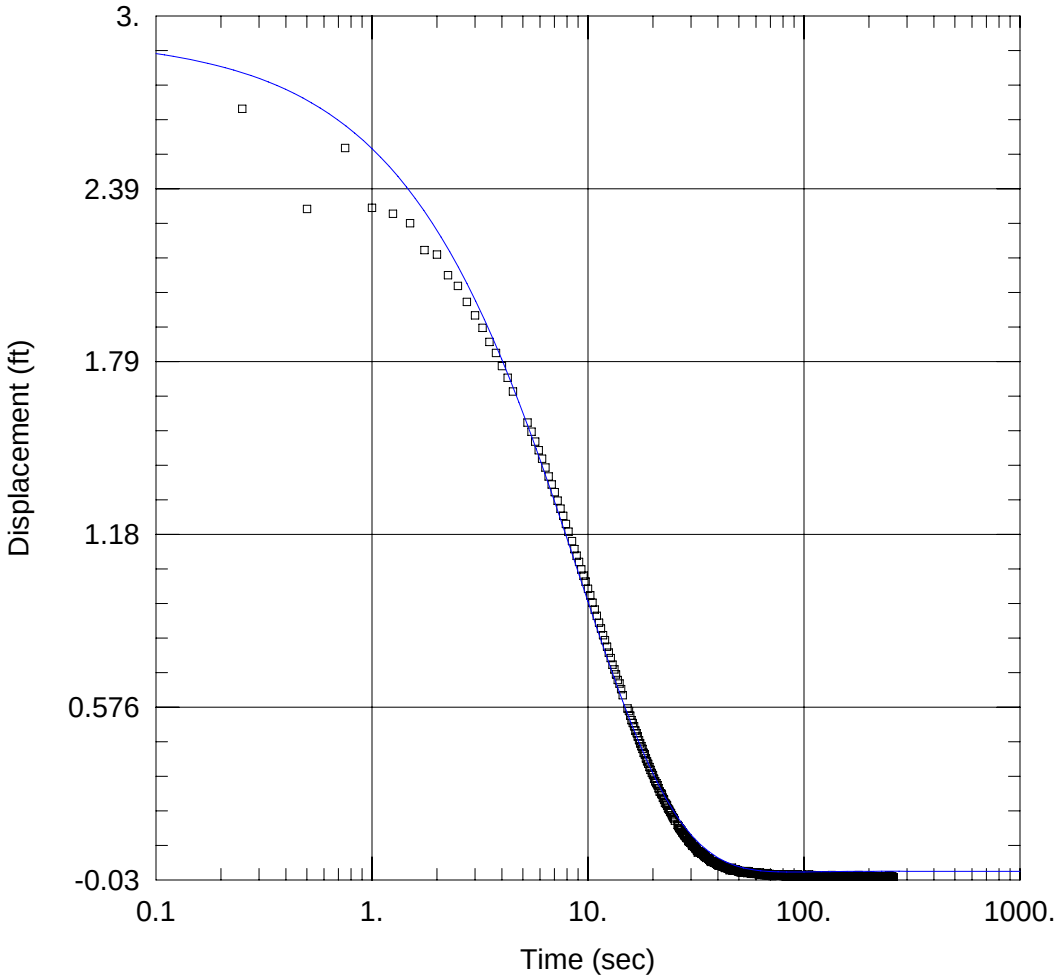
WELL DATA (MW703-DD)

Initial Displacement: 3.664 ft
Total Well Penetration Depth: 17.11 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 17.11 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 12.02 ft/day
Kz/Kr = 1.
Ss = 3.988E-6 ft^{-1}



MW-703DD PNEUMATIC SLUG TEST 3

Data Set: C:\...\MW703DD PS Test3.aqt
Date: 10/24/11 Time: 21:36:30

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-703DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 17.11 ft

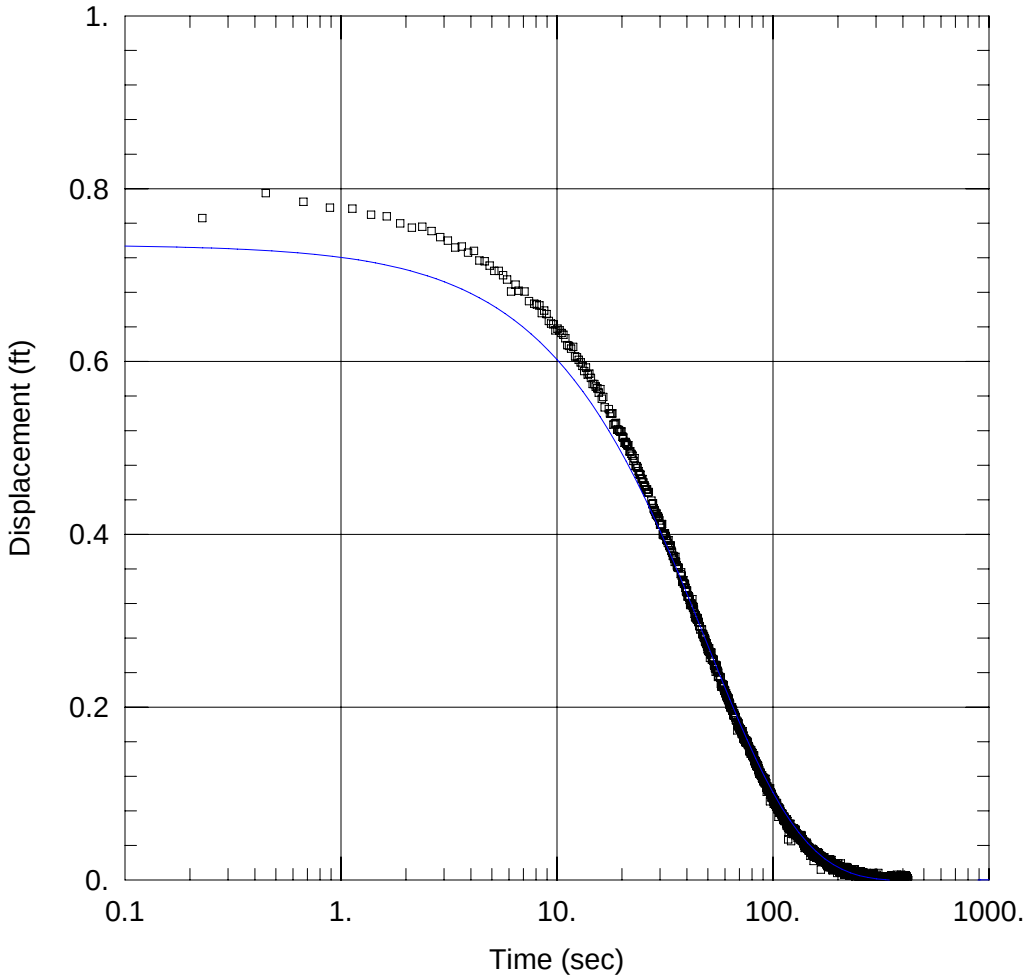
WELL DATA (MW703-DD)

Initial Displacement: 2.929 ft
Total Well Penetration Depth: 17.11 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 17.11 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 13.72 ft/day
Kz/Kr = 1.
Ss = 8.203E-6 ft^{-1}



MW-704DD PNEUMATIC SLUG TEST 1

Data Set: C:\...\MW704DD PS Test1.aqt
Date: 10/24/11 Time: 22:34:12

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-704DD
Test Date: 08-30-2011

AQUIFER DATA

Saturated Thickness: 36.06 ft

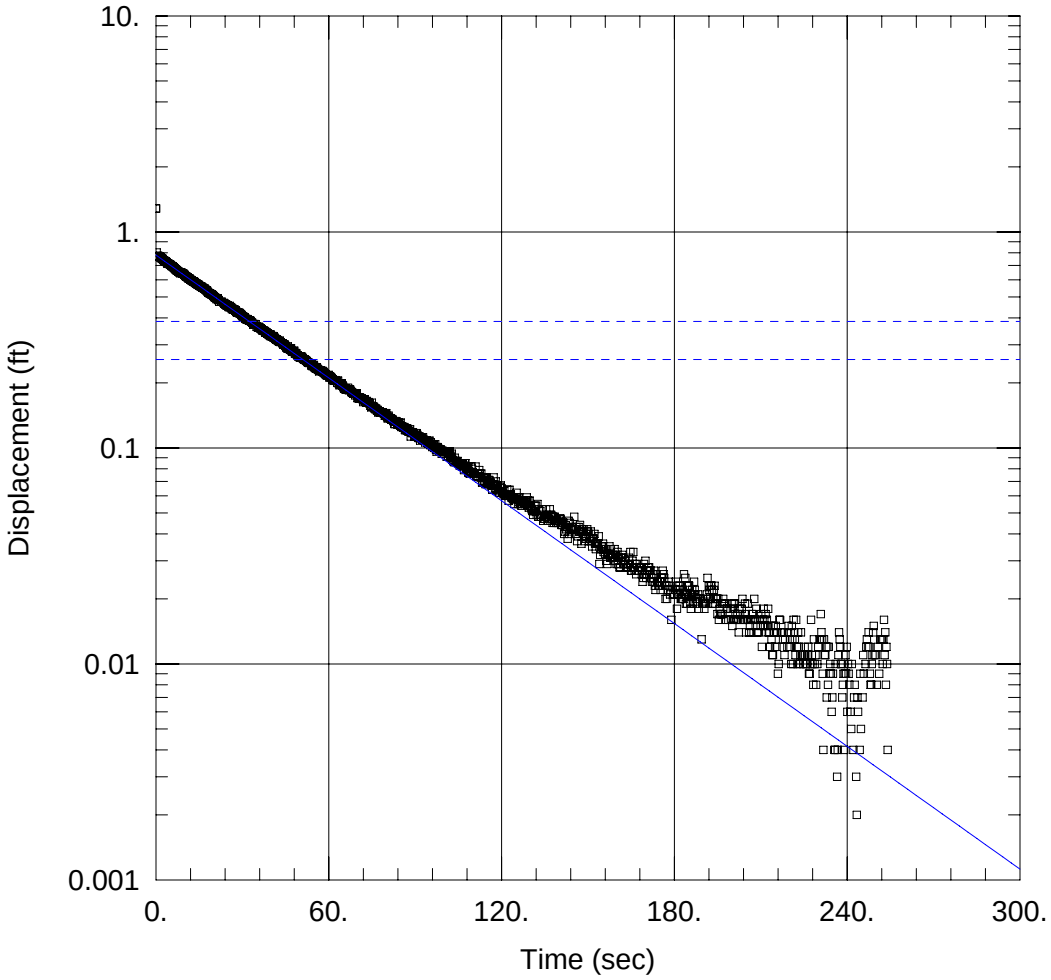
WELL DATA (MW-704DD)

Initial Displacement: 0.735 ft
Total Well Penetration Depth: 36.06 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 36.06 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 2.6 ft/day
Kz/Kr = 1.
Ss = 3.151E-12 ft^{-1}



MW-704DD PNEUMATIC SLUG TEST 2

Data Set: C:\...\MW704DD PS Test2.aqt
Date: 10/24/11 Time: 22:44:43

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-704DD
Test Date: 08-30-2011

AQUIFER DATA

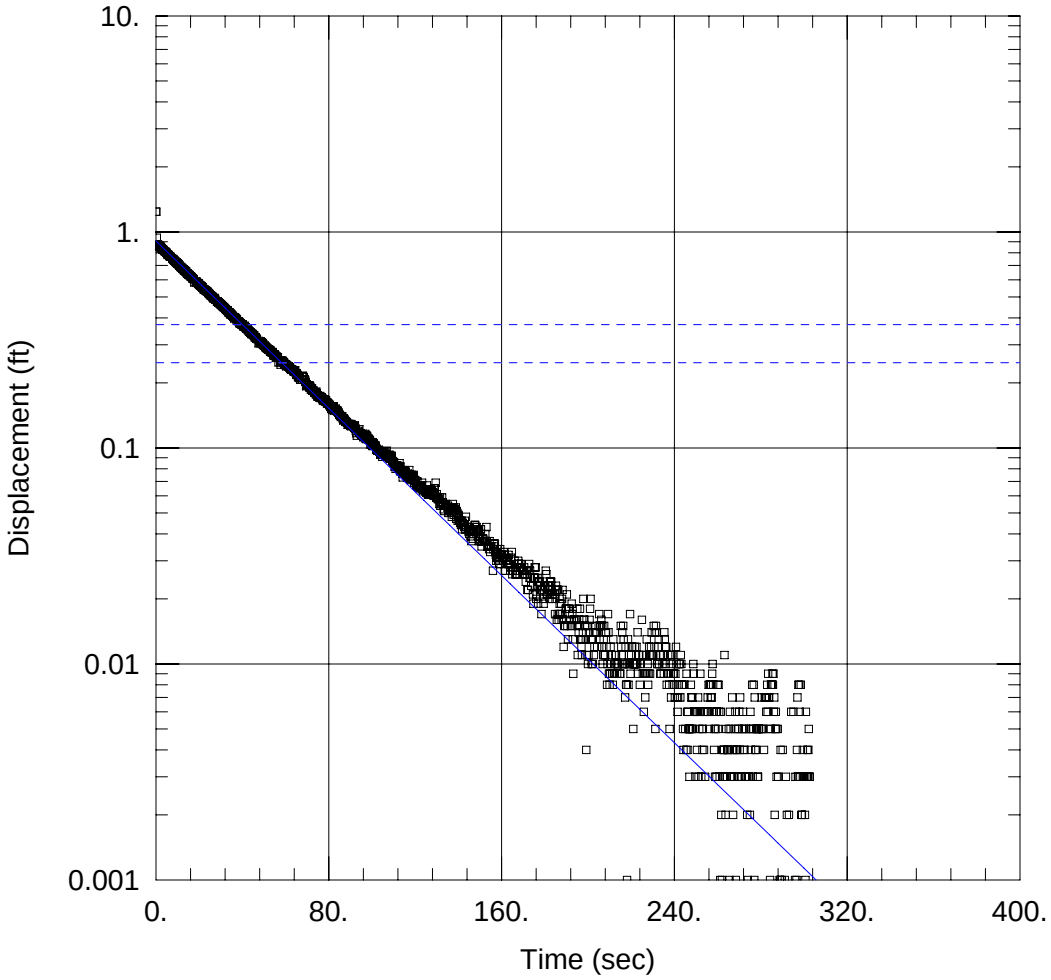
Saturated Thickness: 36.06 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-704DD)

Initial Displacement: 1.283 ft Static Water Column Height: 36.06 ft
Total Well Penetration Depth: 36.06 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 2.601 ft/day y0 = 0.7809 ft



MW-704DD PNEUMATIC SLUG TEST 3

Data Set: C:\...\MW704DD PS Test3.aqt
Date: 10/24/11 Time: 22:59:26

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-704DD
Test Date: 08-30-2011

AQUIFER DATA

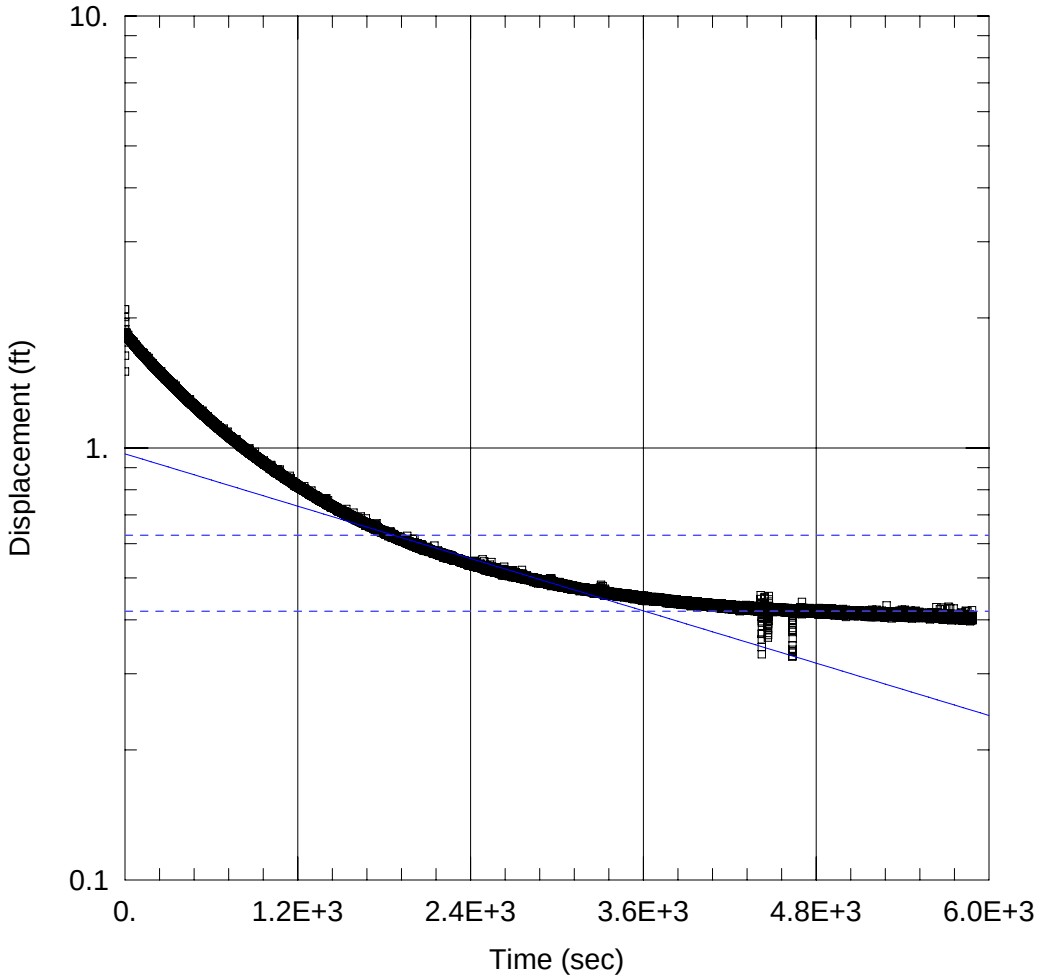
Saturated Thickness: 36.06 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-704DD)

Initial Displacement: 1.24 ft Static Water Column Height: 36.06 ft
Total Well Penetration Depth: 36.06 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 2.657 ft/day y0 = 0.9077 ft



MW705D SOLID SLUG FALLING HEAD TEST 1 EXTRA

Data Set: C:\...\MW705D SS FH Test 1 extra.aqt
Date: 10/24/11 Time: 23:32:22

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-705D
Test Date: 08-31-2011

AQUIFER DATA

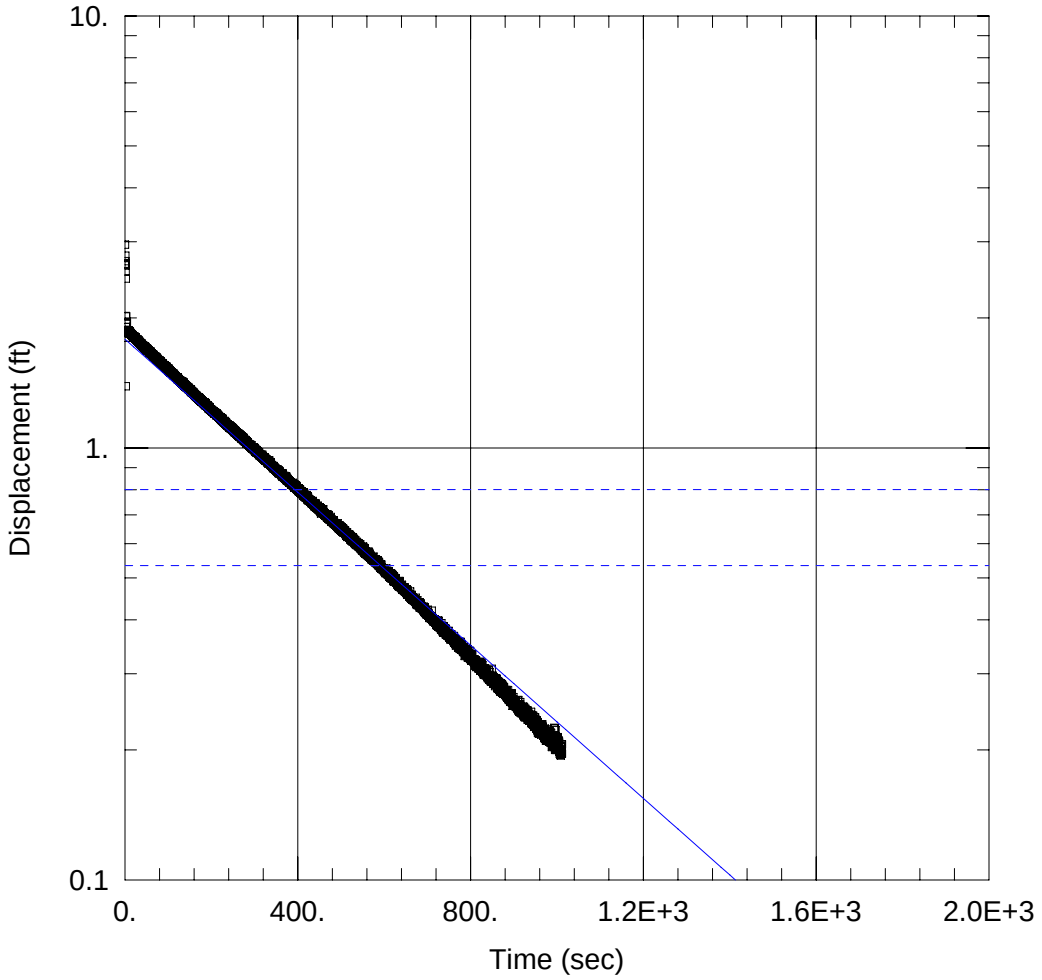
Saturated Thickness: 14.3 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW705-D)

Initial Displacement: 2.094 ft Static Water Column Height: 14.3 ft
Total Well Penetration Depth: 14.3 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.02378 ft/day y0 = 0.9688 ft



MW-706DD SOLID SLUG FALLING HEAD TEST 1

Data Set: C:\...\MW706DD SS FH Test1.aqt
Date: 10/26/11 Time: 11:01:09

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-706DD
Test Date: 08-29-2011

AQUIFER DATA

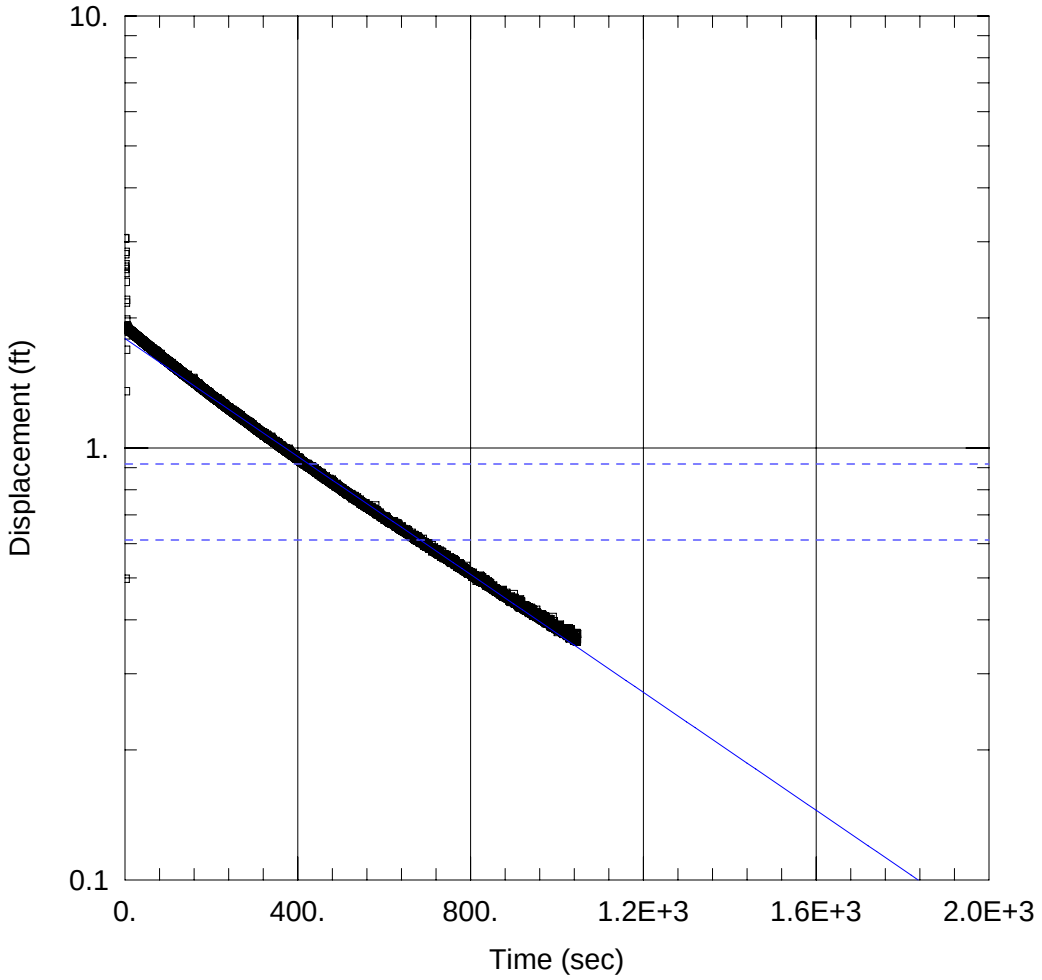
Saturated Thickness: 34. ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW706DD)

Initial Displacement: 2.67 ft Static Water Column Height: 34. ft
Total Well Penetration Depth: 34. ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.241 ft/day y0 = 1.785 ft



MW-706DD SOLID SLUG FALLING HEAD TEST 2

Data Set: C:\...\MW706DD SS FH Test2.aqt
Date: 10/26/11 Time: 11:40:52

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-706DD
Test Date: 08-29-2011

AQUIFER DATA

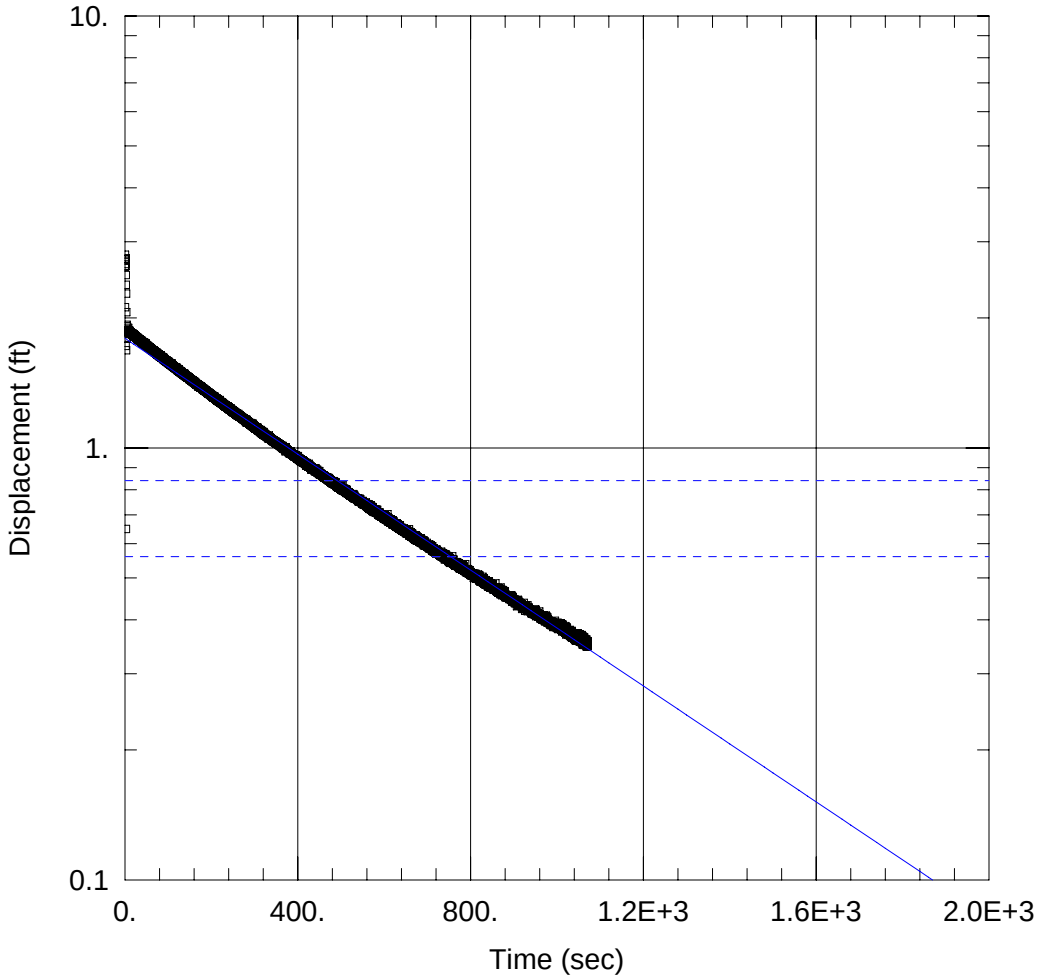
Saturated Thickness: 34. ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW706DD)

Initial Displacement: 3.06 ft Static Water Column Height: 34. ft
Total Well Penetration Depth: 34. ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.1857 ft/day y0 = 1.791 ft



MW-706DD SOLID SLUG FALLING HEAD TEST 3

Data Set: C:\...\MW706DD SS FH Test3.aqt
Date: 10/26/11 Time: 12:17:59

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-706DD
Test Date: 08-29-2011

AQUIFER DATA

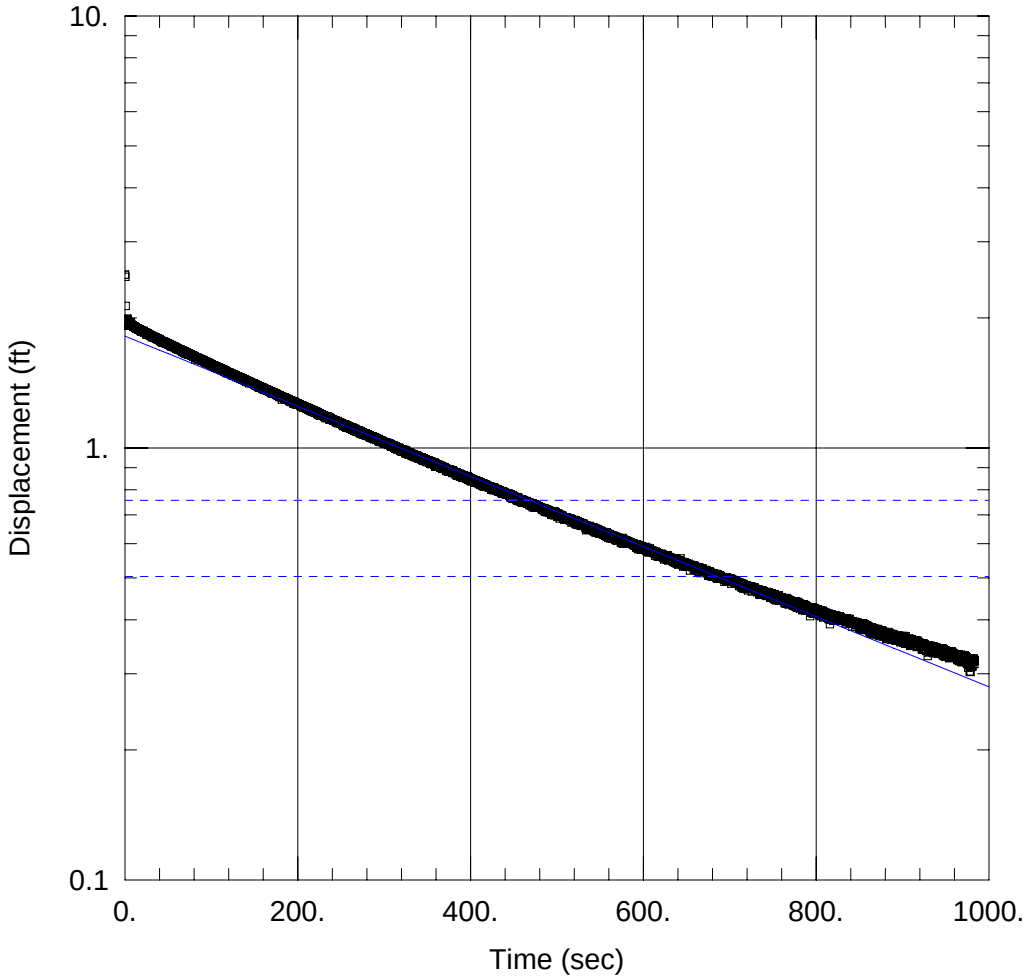
Saturated Thickness: 34. ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW706DD)

Initial Displacement: 2.8 ft Static Water Column Height: 34. ft
Total Well Penetration Depth: 34. ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.1825 ft/day y0 = 1.794 ft



MW-706DD SOLID SLUG RISING HEAD TEST 1

Data Set: C:\...\MW706DD SS RH Test1.aqt
Date: 10/26/11 Time: 12:30:10

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-706DD
Test Date: 08-29-2011

AQUIFER DATA

Saturated Thickness: 34. ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW706DD)

Initial Displacement: 2.52 ft Static Water Column Height: 34. ft
Total Well Penetration Depth: 34. ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 0.2209 ft/day y0 = 1.814 ft

Test Date: 08-29-2011

AQUIFER DATA

Saturated Thickness: 34. ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW706DD)

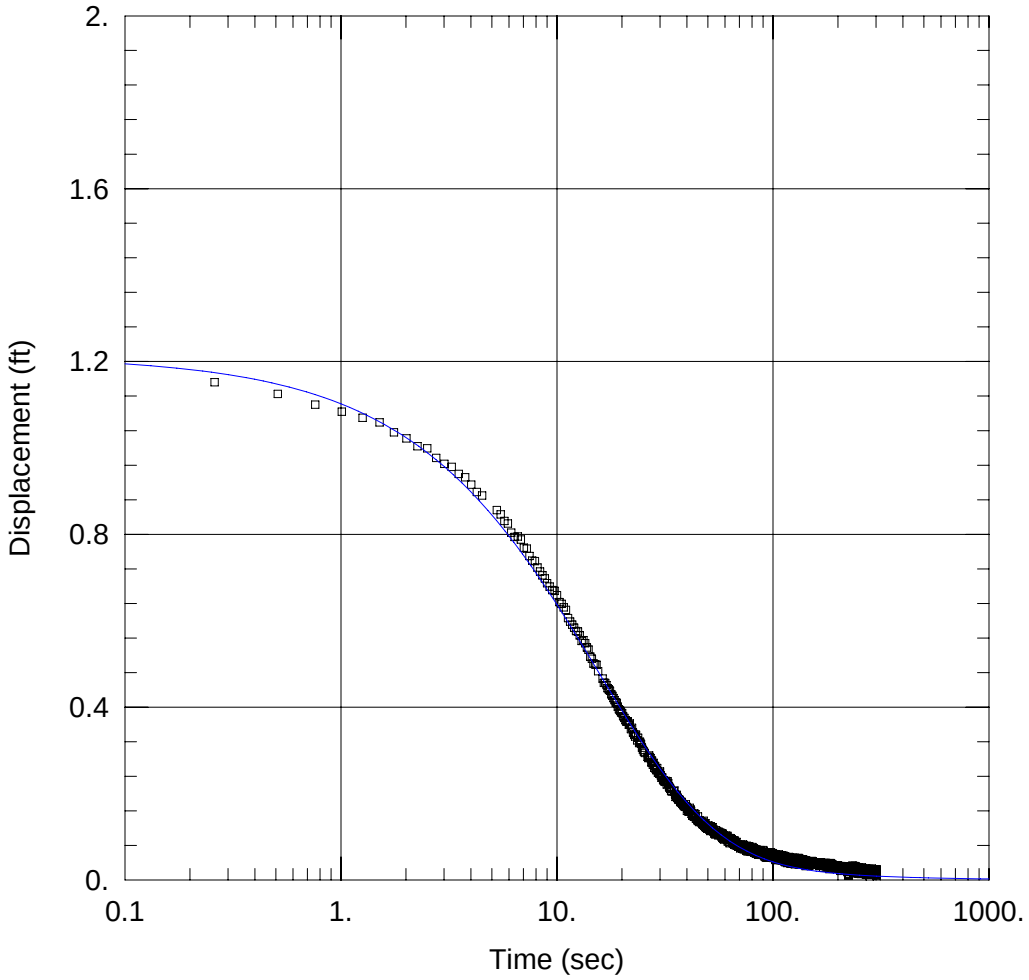
Initial Displacement: 1.978 ft Static Water Column Height: 34. ft
Total Well Penetration Depth: 34. ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice

K = 0.1865 ft/day y0 = 1.642 ft



MW708DD PNEUMATIC SLUG TEST 2

Data Set: C:\...\MW708DD Test 2.aqt
Date: 10/26/11 Time: 15:23:05

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-708DD Test 1
Test Date: 08-26-2011

AQUIFER DATA

Saturated Thickness: 31.58 ft

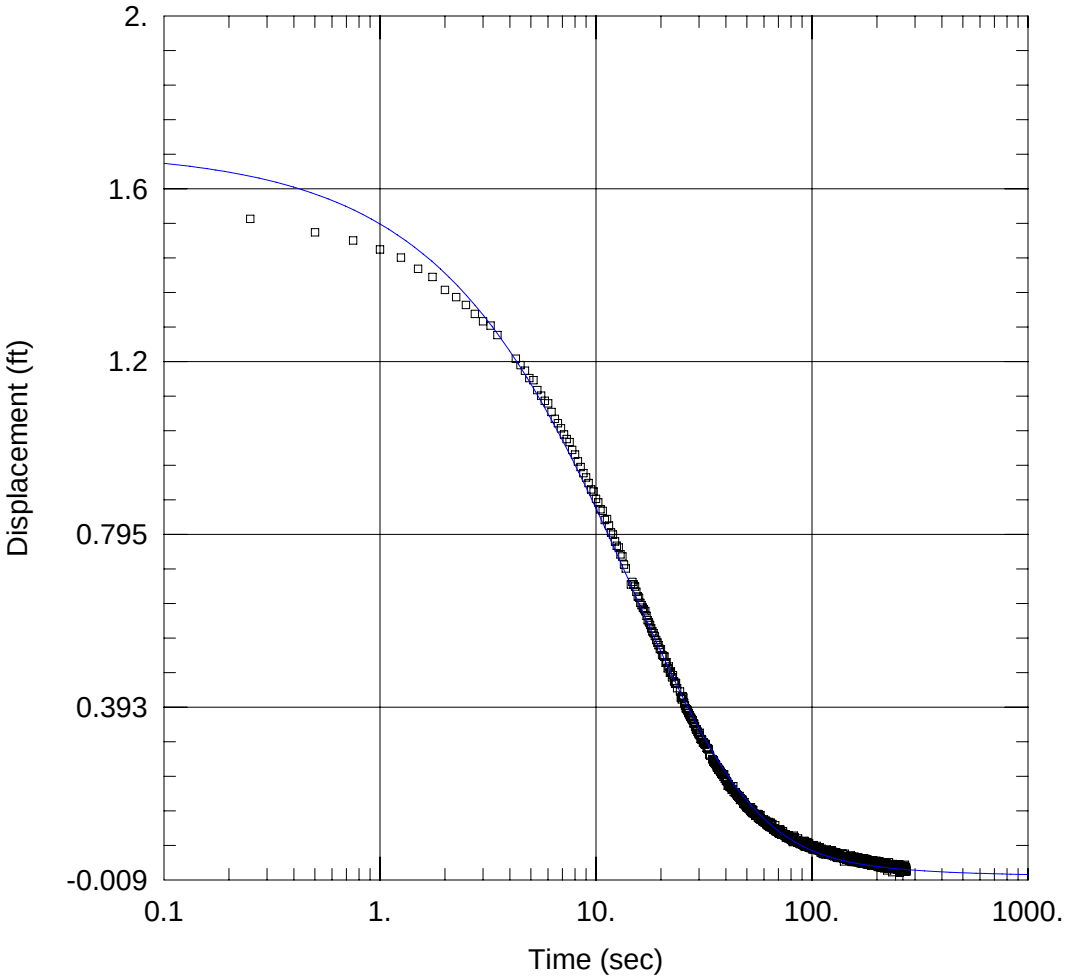
WELL DATA (MW708DD)

Initial Displacement: 1.214 ft
Total Well Penetration Depth: 31.58 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 31.58 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 7.399 ft/day
Kz/Kr = 0.001
Ss = 2.164E-5 ft^{-1}



MW708DD PNEUMATIC SLUG TEST 4

Data Set: C:\...\MW708DD Test 4.aqt
Date: 10/26/11 Time: 15:47:03

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-708DD
Test Date: 08-26-2011

AQUIFER DATA

Saturated Thickness: 31.58 ft

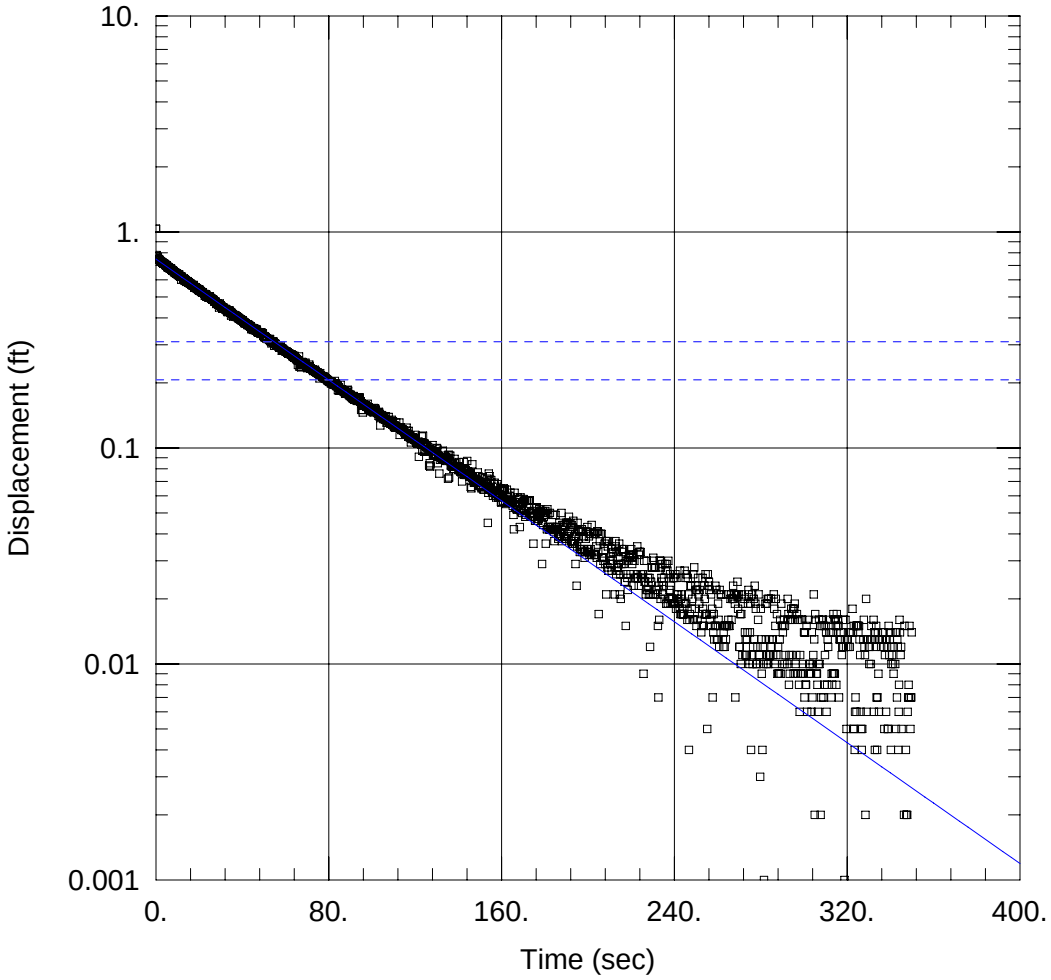
WELL DATA (MW708DD)

Initial Displacement: 1.69 ft
Total Well Penetration Depth: 31.58 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 31.58 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 6.966 ft/day
Kz/Kr = 0.001
Ss = 5.019E-5 ft^{-1}



MW709DD PNEUMATIC SLUG TEST1

Data Set: C:\...\MW709DD PS Test1.aqt
Date: 10/26/11 Time: 21:05:55

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-709DD
Test Date: 08-26-2011

AQUIFER DATA

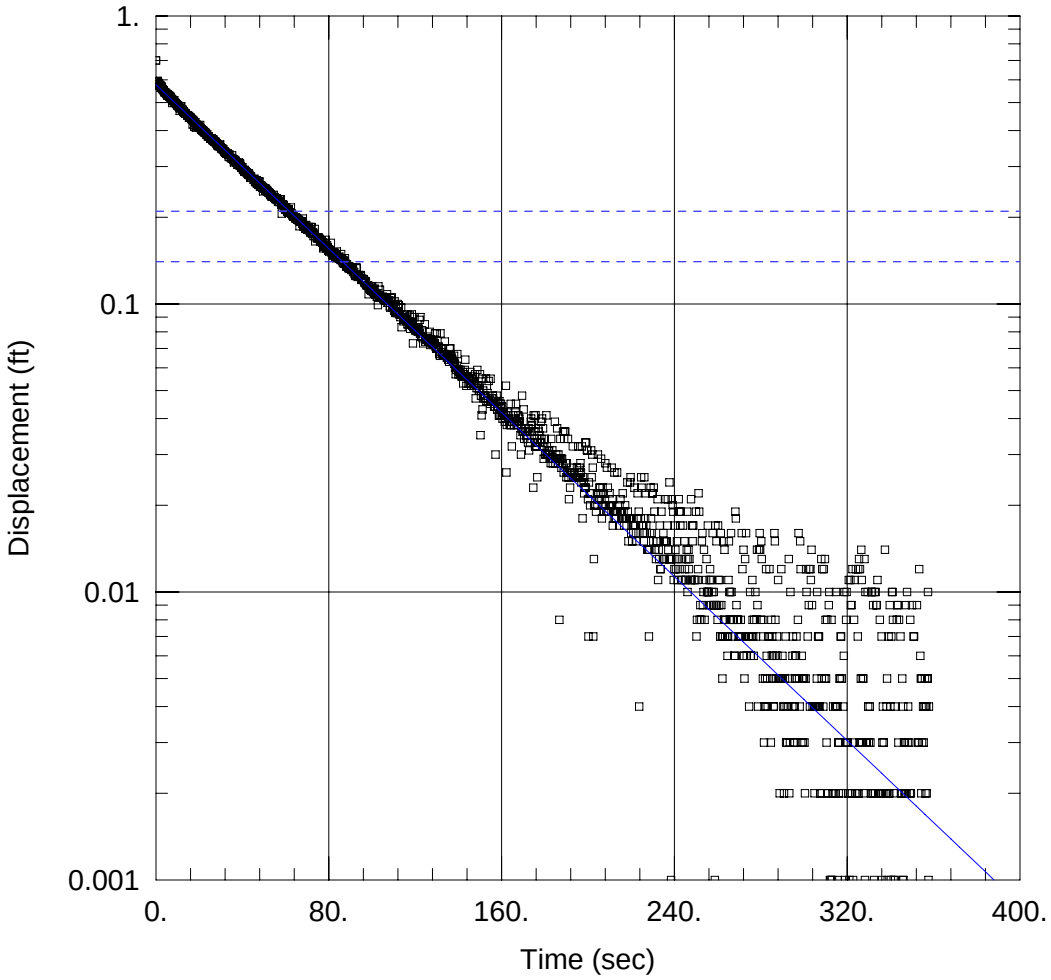
Saturated Thickness: 32.34 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-709DD)

Initial Displacement: 1.033 ft
Total Well Penetration Depth: 32.34 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 32.34 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
K = 1.889 ft/day
y0 = 0.7485 ft



MW709DD PNEUMATIC SLUG TEST2

Data Set: C:\...\MW709DD PS Test2.aqt
Date: 10/26/11 Time: 21:11:01

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-709DD
Test Date: 08-26-2011

AQUIFER DATA

Saturated Thickness: 32.34 ft Anisotropy Ratio (Kz/Kr): 1.

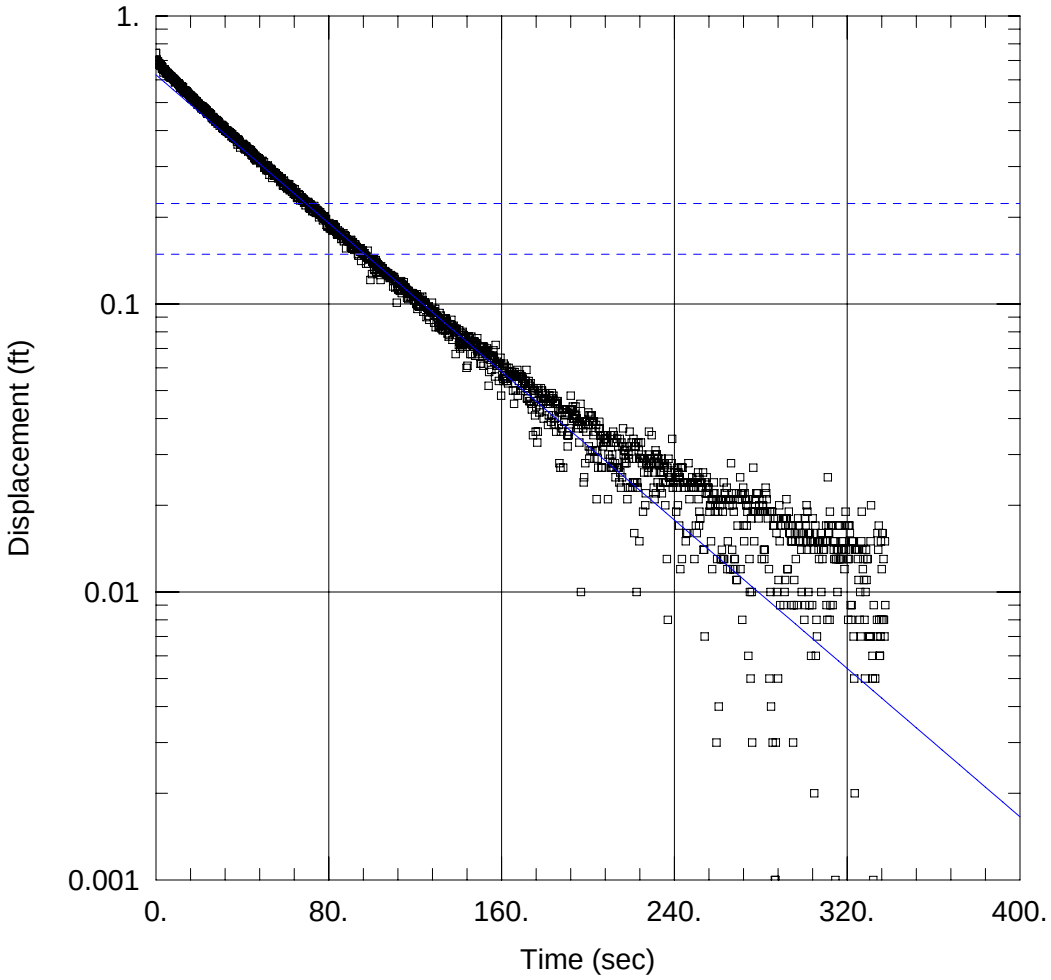
WELL DATA (MW-709DD)

Initial Displacement: 0.7 ft
Total Well Penetration Depth: 32.34 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 32.34 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice

K = 1.922 ft/day y0 = 0.577 ft



MW709DD PNEUMATIC SLUG TEST3

Data Set: C:\...\MW709DD PS Test3.aqt
Date: 10/26/11 Time: 21:15:58

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-709DD
Test Date: 08-26-2011

AQUIFER DATA

Saturated Thickness: 32.34 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-709DD)

Initial Displacement: 0.744 ft Static Water Column Height: 32.34 ft
Total Well Penetration Depth: 32.34 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 1.739 ft/day y0 = 0.6242 ft

AQUIFER DATA

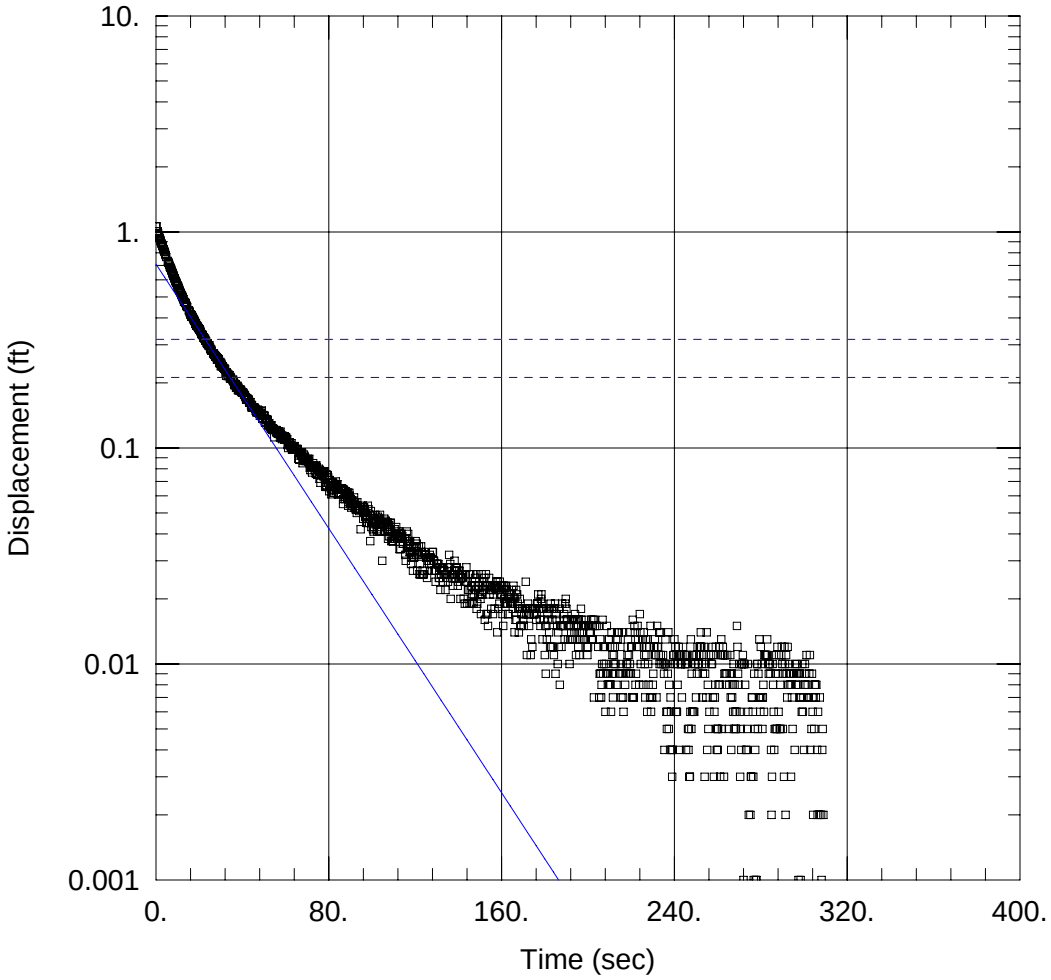
Saturated Thickness: 19.53 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW710DD)

Initial Displacement: 1.072 ft
Total Well Penetration Depth: 19.53 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 19.53 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
K = 4.227 ft/day
y0 = 0.8043 ft



MW710DD PNEUMATIC SLUG TEST 4

Data Set: C:\...\MW710DD test4.aqt
Date: 10/26/11 Time: 23:37:30

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-710DD
Test Date: 08-24-2011

AQUIFER DATA

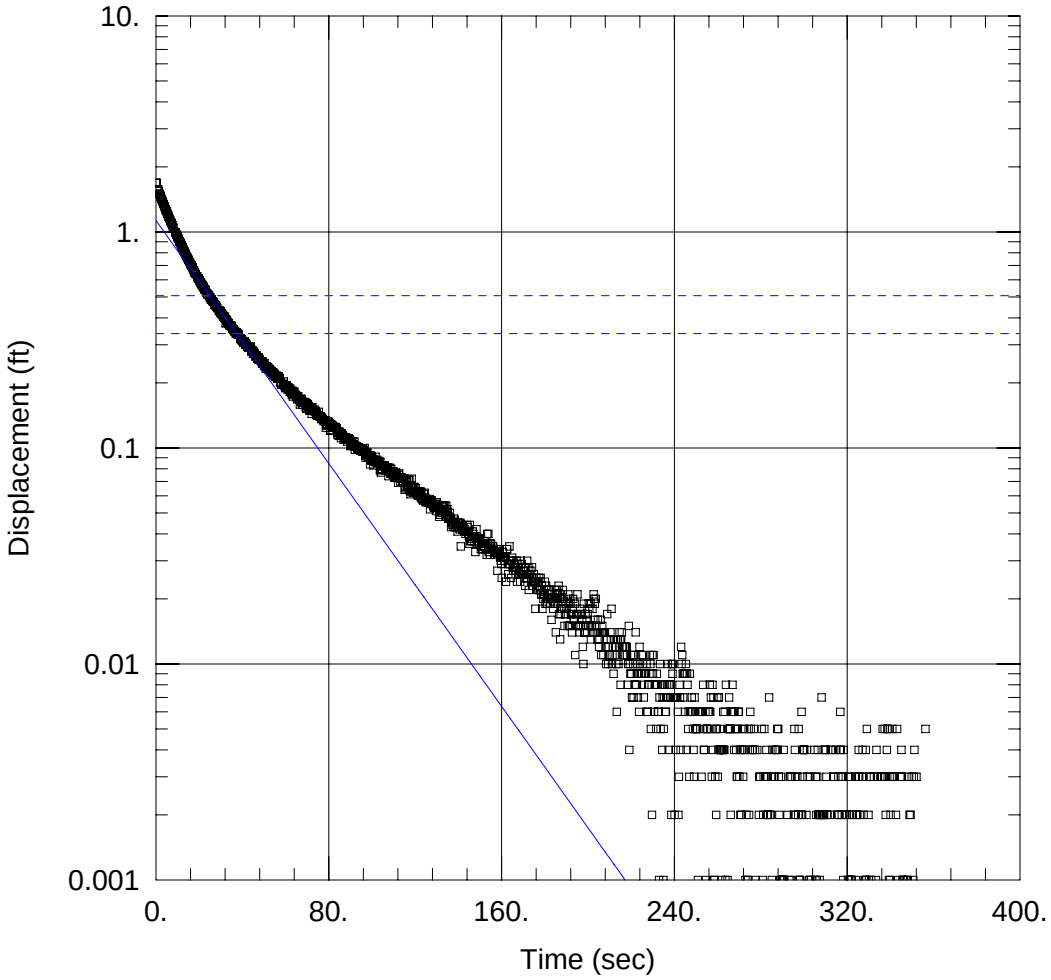
Saturated Thickness: 19.53 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW710DD)

Initial Displacement: 1.06 ft
Total Well Penetration Depth: 19.53 ft
Casing Radius: 0.0833 ft
Static Water Column Height: 19.53 ft
Screen Length: 10. ft
Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
K = 3.809 ft/day
y0 = 0.7095 ft



MW710DD PNEUMATIC SLUG TEST 5

Data Set: C:\...\MW710DD test5.aqt
Date: 10/26/11 Time: 23:42:37

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.
Location: Lockport, New York
Test Well: MW-710DD
Test Date: 08-24-2011

AQUIFER DATA

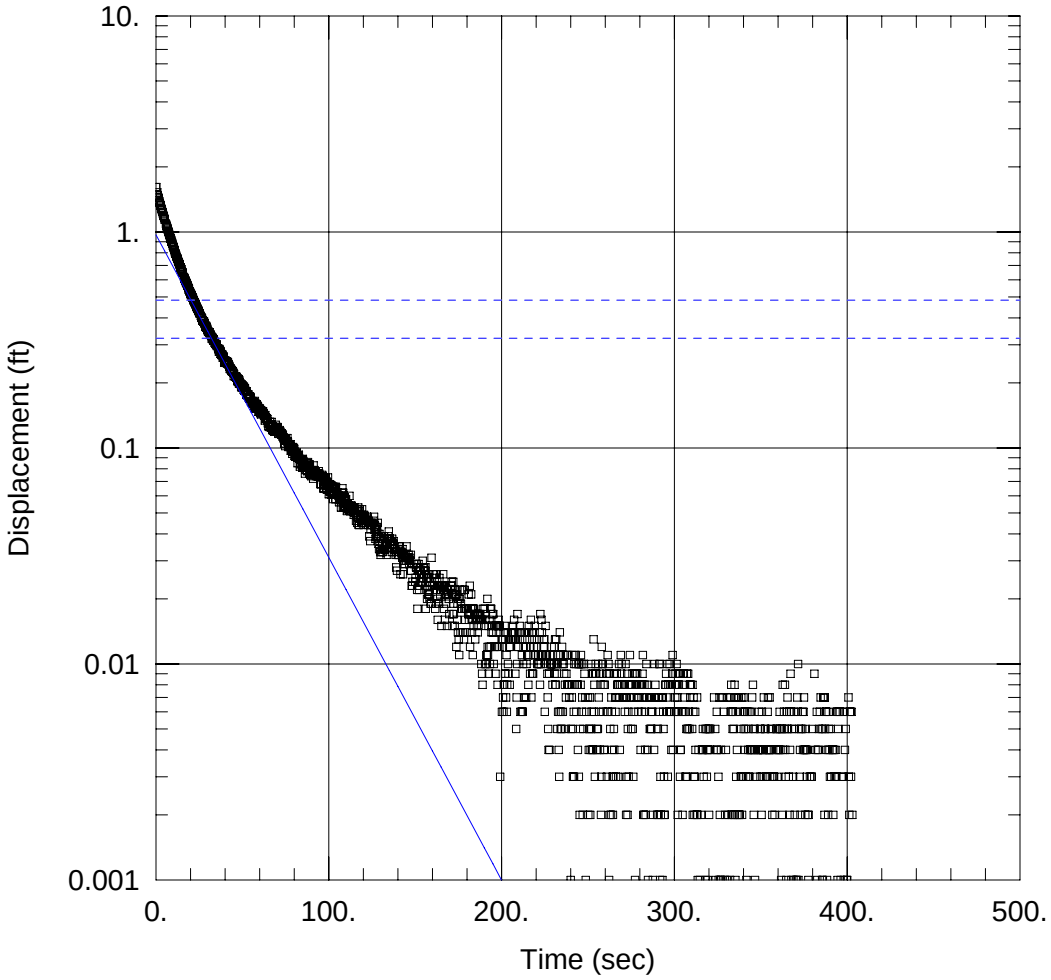
Saturated Thickness: 19.53 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW710DD)

Initial Displacement: 1.69 ft Static Water Column Height: 19.53 ft
Total Well Penetration Depth: 19.53 ft Screen Length: 10. ft
Casing Radius: 0.0833 ft Well Radius: 0.1575 ft

SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 3.5 ft/day y0 = 1.129 ft



MW710DD PNEUMATIC SLUG TEST 6

Data Set: C:\...\MW710DD test6.aqt
Date: 10/26/11 Time: 23:46:45

PROJECT INFORMATION

Client: USACE Buffalo District
Project: Guterl Speciality Steel Corp.

Case Narrative
LOT NUMBER: F1H020470

This report contains the analytical results for the four samples received under chain of custody by TestAmerica in St. Louis on August 2, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

There were no nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

F1H020470

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Isotopic Thorium by Alpha Spectroscopy	EML A-01-R MOD	
Isotopic Uranium by Alpha Spectroscopy	EML A-01-R MOD

SAMPLE SUMMARY

F1H020470

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
MLCN1	001	CITY OF LOCKPORT SEWER LOCATION #1 US-0001	07/27/11	13:55
MLCN2	002	CITY OF LOCKPORT SEWER LOCATION #1 UW-0001	07/27/11	13:45
MLCN3	003	CITY OF LOCKPORT SEWER LOCATION #2 US-0002	07/27/11	14:35
MLCN4	004	CITY OF LOCKPORT SEWER LOCATION #2 UW-0002	07/27/11	14:25

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Case Narrative
LOT NUMBER: F1H090481
Revised

This report contains the analytical results for the eight samples received under chain of custody by TestAmerica in St. Louis on August 5, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

This report is revised to correct sample idenification numbers for sample-002 and 006 to A04AMW230001 and A04AMW230001 Dissolved.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1229246
The CCV %D for Dichlorodifluoromethane is outside the established QC limits. This analyte is not part of the analysis request and thus this excursion does not affect the data.

The MS/MSD recoveries for 1,1-Dichloroethene, 1,1-Dichloroethane, 1,2-Dichloroethene (total), 1,1,1-Trichloroethane, Benzene, Trichloroethene, and Bromodichloromethane are outside the established QC limits. The RPD is within method acceptance criteria except for 1,4-Dioxane indicating a possible matrix interference. Method performance is demonstrated by acceptable LCS recovery.

The sample required a dilution due to high concentrations of target analytes. There was insufficient sample to perform the dilution and reanalysis.

The Method Blank surrogate recovery for Toluene-d8 is outside acceptance limits. The samples associated with this method blank demonstrated acceptable surrogate recoveries indicating the surrogate excursion is isolated to the method blank and not indicative of the batch.

During screening F1H090481did not appear to have hits above the calibration range. Screening is not as accurate as the full analytical test. The sample was selected to be used for the MS/MSD in the batch. Therefore, all three vials were consumed in the first run. "E" flagged concentration values should be considered estimates.

Affected Samples:
F1H090481 (1): A04DMW240001

Batch: 1230013
There was insufficient sample volume to perform MS/MSD analysis. An LCS/LCSD was performed to demonstrate accuracy and replicate precision.

Affected Samples:
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001

The samples were analyzed at a dilution due to high concentrations of target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090481 (2): A04DMW230001

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1222063
The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001

F1H090481 (4): A04BMW190001
F1H090481 (5): A04DMW240001 DISSOLVED
F1H090481 (6): A04DMW230001 DISSOLVED
F1H090481 (7): A04DMW713D0001 DISSOLVED
F1H090481 (8): A04BMW190001 DISSOLVED

Chloride (MCAWW 300.0A)

Batch: 1224118
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001
F1H090481 (4): A04BMW190001

Sulfate (MCAWW 300.0A)

Batch: 1224123
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001
F1H090481 (4): A04BMW190001

Nitrite as N (MCAWW 300.0A)

Batch: 1224121
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (3): A04DMW713D0001
F1H090481 (4): A04BMW190001

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001

F1H090481 (4): A04BMW190001

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224122
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H090481 (1): A04DMW240001
F1H090481 (2): A04DMW230001
F1H090481 (3): A04DMW713D0001
F1H090481 (4): A04BMW190001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Initiated By: SW Date: 8.5.11 Time: 0900

Shipping Information

Shipper: (FedEx) UPS DHL Courier Client Other: _____ Multiple Packages: (Y) N

Shipping # (s):*				Sample Temperature (s):**			
1.	4485 0258 2587	6.		1.	3	6.	
2.	2598	7.		2.	2	7.	
3.		8.		3.		8.	
4.		9.		4.		9.	
5.		10.		5.		10.	

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Notes:

Received bottles for Filtered metals, Iso4, & Total U - not on COC - log per LF AB 8-9-11

Corrective Action:

☐ Client Contact Name: _____ Informed by: _____

☐ Sample(s) processed "as is"

☐ Sample(s) on hold until: _____ If released, notify: _____

Project Management Review: _____ Date: 8/11/2011

THIS FORM MUST BE COMPLETED AT THE TIME THE ITEMS ARE BEING CHECKED IN. IF ANY ITEM IS COMPLETED BY SOMEONE OTHER THAN THE INITIATOR, THEN THAT PERSON IS REQUIRED TO APPLY THEIR INITIAL AND THE DATE NEXT TO THAT ITEM.

Case Narrative
LOT NUMBER: F1H090496

This report contains the analytical results for the six samples received under chain of custody by TestAmerica in St. Louis on August 6, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1222063
The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

Affected Samples:
F1H090496 (1): A04AMW603D0001
F1H090496 (2): A04AMW220001
F1H090496 (3): A04BMW180001
F1H090496 (4): A04AMW603D0001 DISSOLVED

Batch: 1222064
The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

The MSD recovery for Calcium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Strontium was observed in the CCB above 3X the MDL. Associated samples which are either non-detect for the contaminant or exhibit concentrations greater than ten (10) times the concentrations observed in the CCB and does not require re-analysis.

Affected Samples:
F1H090496 (5): A04AMW22001 DISSOLVED
F1H090496 (6): A04BMW180001 DISSOLVED

Chloride (MCAWW 300.0A)

Batch: 1224124
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090496 (1): A04AMW603D0001
F1H090496 (2): A04AMW220001
F1H090496 (3): A04BMW180001

Sulfate (MCAWW 300.0A)

Batch: 1224129
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090496 (1): A04AMW603D0001
F1H090496 (2): A04AMW220001
F1H090496 (3): A04BMW180001

Fluoride (MCAWW 300.0A)

Batch: 1224125
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090496 (3): A04BMW180001

Nitrite as N (MCAWW 300.0A)

Batch: 1224127
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H090496 (1): A04AMW603D0001
F1H090496 (2): A04AMW220001
F1H090496 (3): A04BMW180001

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224128
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H090496 (1): A04AMW603D0001
F1H090496 (2): A04AMW220001
F1H090496 (3): A04BMW180001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

F1H090496

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Alkalinity	MCAWW 310.1	MCAWW 310.1

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Notes:

Received bottles for Filter metals, Iso-U, + Tetra-U - not on COC - ok per LF - AB 8-9-11

Corrective Action:

☐ Client Contact Name: _____ Informed by: _____

☐ Sample(s) processed "as is"

☐ Sample(s) on hold until: _____ If released, notify: _____

Project Management Review: [signature] Date: 8/10/11

Case Narrative
LOT NUMBER: F1H090504

This report contains the analytical results for the 10 samples received under chain of custody by TestAmerica in St. Louis on August 9, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1230013
There was insufficient sample volume to perform MS/MSD analysis. An LCS/LCSD was performed to demonstrate accuracy and replicate precision.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1222064
The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

The MSD recovery for calcium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Strontium was observed in the CCB above 3X the MDL. Associated samples which are either non-detect for the contaminant or exhibit concentrations greater than ten (10) times the concentrations observed in the CCB and do not require re-analysis.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02
F1H090504 (6): A02MW110001 DISSOLVED
F1H090504 (7): A02MW090001 DISSOLVED
F1H090504 (8): A02MW080001 DISSOLVED
F1H090504 (9): SEEP 01
F1H090504 (10): SEEP 02

Chloride (MCAWW 300.0A)

Batch: 1224130
The sampls was analyzed at dilution, due to high concentrations of the target analytes.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

Sulfate (MCAWW 300.0A)

Batch: 1224135
The sampls was analyzed at dilution, due to high concentrations of the target analytes.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

Nitrite as N (MCAWW 300.0A)

Batch: 1224133
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224134
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H090504 (1): A02MW110001
F1H090504 (2): A02MW090001
F1H090504 (3): A02MW080001
F1H090504 (4): SEEP 01
F1H090504 (5): SEEP 02

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

F1H090504

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Shipping Information

Shipper: (FedEx) UPS DHL Courier Client Other: _____ Multiple Packages: (Y) N

Shipping # (s):*				Sample Temperature (s):**			
1.	4485 02583105	6.		1.	2	6.	
2.	3127	7.		2.	ambient	7.	
3.		8.		3.		8.	
4.		9.		4.		9.	
5.		10.		5.		10.	

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Notes:

Received bottles for Filtered Metals, Total-U, + Iso-U-not on COC- 1 cg per LF

Case Narrative
LOT NUMBER: F1H100419

This report contains the analytical results for the six samples received under chain of custody by TestAmerica in St. Louis on August 10, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1230013
There was insufficient sample volume to perform MS/MSD analysis. An LCS/LCSD was performed to demonstrate accuracy and replicate precision.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1223088
The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

The MSD recovery for calcium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Strontium was observed in the CCB above 3X the MDL. Associated samples which are either non-detect for the contaminant or exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001
F1H100419 (4): MW705D0001 DISSOLVED
F1H100419 (5): MW705DD0001 DISSOLVED
F1H100419 (6): A04DMW711D0001 DISSOLVED

Chloride (MCAWW 300.0A)

Batch: 1224136
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001

Sulfate (MCAWW 300.0A)

Batch: 1224141
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224140
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001

Nitrite as N (MCAWW 300.0A)

Batch: 1227147
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Samples F1H100419-001 and 002 were analyzed within 48 hour hold for Nitrite on 8/10/11, but due to a failed bracketing CCV, they were re-analyzed for Nitrite in batch 1227147 on 8/11/11, out of 48 hour hold.

Affected Samples:
F1H100419 (1): MW705D0001
F1H100419 (2): MW705DD0001
F1H100419 (3): A04DMW711D0001

Sample F1H100419-003 was analyzed upon receipt, within 48 hour hold, on 8/10/11. However, due to a failed bracketing CCV for Nitrite, this sample required re-analysis on 8/11/11. Due to mis-injection in that run, this sample was finally re-analzed on 8/12/11 for Nitrite in batch 1224151. Results are reported from the latter run, out of 48 hour hold.

Affected Samples:
F1H100419 (3): A04DMW711D0001

Total Dissolved Solids (MCAWW 160.1)

Batch: 1228283
The sample was analyzed at a dilution based on high concentrations of target analytes. The reporting limit has been adjusted accordingly.

Affected Samples:
F1H100419 (2): MW705DD0001

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

F1H100419

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Alkalinity	MCAWW 310.1	MCAWW 310.1
Chloride	MCAWW 300.0A	MCAWW 300.0A
Filterable Residue (TDS)	MCAWW 160.1	MCAWW 160.1
Fluoride	MCAWW 300.0A	MCAWW 300.0A
Isotopic Uranium by Alpha Spectroscopy	EML A-01-R MOD	
ICP-MS (6020A)	SW846 6020A

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

4.		9.		4.		9.	
5.		10.		5.		10.	

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Case Narrative
LOT NUMBER: F1H110460

This report contains the analytical results for the 14 samples received under chain of custody by TestAmerica in St. Louis on August 11, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1230199
Tertahydrofuran was removed from the initial calibration lowest point due to poor response. Isobutanol, n-Butanol, 2-Chloroethylvinyl ether, 4-Methyl-2-pentanone and 2-Hexanone were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration. The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

Affected Samples:
F1H110460 (8): A04MW604D0001
F1H110460 (9): A04DMW709D0001
F1H110460 (10): A04BMW605D0001
F1H110460 (11): A04BMW260001
F1H110460 (12): A04BMW9000
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

The sample was screened to determine if high concentrations of target analytes were present. The sample was analyzed at a dilution of 5X and 50X due to high concentrations of target analytes. The reporting limit has been adjusted for the dilution since no analysis at a lesser dilution was performed.

Affected Samples:
F1H110460 (11): A04BMW260001

The internal standard(s) recovery is outside the lower QC limit, indicating a potential positive bias. There were no target analytes associated with this internal standard observed above the reporting limit in the sample; therefore the sample data was not adversely affected by this excursion. The original sample results are provided.

Affected Samples:
F1H110460 (10): A04BMW605D0001
F1H110460 (11): A04BMW260001
F1H110460 (12): A04BMW9000

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1224018
Strontium was observed in the CCB above the reporting limit. Associated samples which exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis. Original results are reported.

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H110460 (1): A04MW604D0001 DISSOLVED
F1H110460 (2): A04DMW709DD0001 DISSOLVED
F1H110460 (3): A04BMW605D0001 DISSOLVED
F1H110460 (4): A04BMW260001 DISSOLVED
F1H110460 (6): A04BMW9001 DISSOLVED
F1H110460 (7): A04DMW704DD0001 DISSOLVED
F1H110460 (8): A04MW604D0001
F1H110460 (9): A04DMW709D0001
F1H110460 (11): A04BMW260001
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

Fluoride (MCAWW 300.0A)

Batch: 1224143
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H110460 (10): A04BMW605D0001
F1H110460 (12): A04BMW9000

Nitrate as N (MCAWW 300.0A)

Batch: 1224144
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

Sulfate (MCAWW 300.0A)

Batch: 1224147
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H110460 (8): A04MW604D0001
F1H110460 (9): A04DMW709D0001
F1H110460 (10): A04BMW605D0001
F1H110460 (11): A04BMW260001
F1H110460 (12): A04BMW9000
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

Nitrite as N (MCAWW 300.0A)

Batch: 1224145
The following samples were reported ND for Nitrite, due to matrix interference with Chloride in the undiluted analyse. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H110460 (8): A04MW604D0001
F1H110460 (9): A04DMW709D0001
F1H110460 (10): A04BMW605D0001
F1H110460 (11): A04BMW260001
F1H110460 (12): A04BMW9000
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224146
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H110460 (8): A04MW604D0001
F1H110460 (9): A04DMW709D0001
F1H110460 (10): A04BMW605D0001
F1H110460 (11): A04BMW260001
F1H110460 (12): A04BMW9000
F1H110460 (13): A04BMW9001
F1H110460 (14): A04DMW704DD0001

Isotopic Uranium by Alpha Spectroscopy (A-01-R MOD)

Batch: 1231145
The reporting limit for Uranium 238 was not met due to the presence of the nuclide in the sample. The data is reported with the MDA achieved.

Affected Samples:
F1H110460 (3): A04BMW605D0001 DISSOLVED
F1H110460 (10): A04BMW605D0001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CUR Form #: 0 7 7

CONDITION UPON RECEIPT FORM

Client: Shaw Env.

Quote No: 89251

COC/RFA No: 006

Initiated By: SH Date: 8.11.11 Time: 0930

Shipping Information

Shipper: (FedEx) UPS DHL Courier Client Other: _____ Multiple Packages: (Y) N

Shipping # (s):*				Sample Temperature (s):**			
1.	4485 0258 3333	6.		1.	2	6.	
2.	3403	7.		2.	ambient	7.	
3.	3425	8.		3.		8.	
4.		9.		4.		9.	
5.		10.		5.		10.	

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Notes:

M
A04BW709SS0001 filtered & total and
6040A001
had pH of 7; per L.F. used HNO_3 lot K11059
to correct pH.

Corrective Action:

☐ Client Contact Name: _____ Informed by: _____

☐ Sample(s) processed "as is"

☐ Sample(s) on hold until: _____ If released, notify: _____

Project Management Review: _____ Date: 8/12/11

THIS FORM MUST BE COMPLETED AT THE TIME THE ITEMS ARE BEING CHECKED IN. IF ANY ITEM IS COMPLETED BY SOMEONE OTHER THAN THE INITIATOR, THEN THAT PERSON IS REQUIRED TO APPLY THEIR INITIAL AND THE DATE NEXT TO THAT ITEM.

Case Narrative
LOT NUMBER: F1H120447

This report contains the analytical results for the 10 samples received under chain of custody by TestAmerica in St. Louis on August 12, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1230199 and 1231041
Tertahydrofuran was removed from the initial calibration lowest point due to poor response. Isobutanol, n-Butanol, 2-Chloroethylvinyl ether, 4-Methyl-2-pentanone and 2-Hexanone were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration. The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Batch: 1230199
The internal standard(s) recovery is outside the lower QC limit, indicating a potential positive bias. There were no target analytes associated with this internal standard observed above the reporting limit in the sample; therefore the sample data was not adversely affected by this excursion.

Affected Samples:
F1H120447 (6): A04MW602D0001

Batch: 1231041
The sample was analyzed at a dilution due to high concentrations of target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

The internal standard recoveries are within QC limits as compared to the IS limits set by the CCV for this 12 hour clock. However, the client requirement for DOD4.1 has the IS limits set to the mid-point of the ICAL as requested. The internal standard(s) recovery is outside the lower QC limit, indicating a potential positive bias. There were no target analytes associated with this internal standard observed above the reporting limit in the sample; therefore the sample data was not adversely affected by this excursion.

Affected Samples:
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1227139
The MS (MSD) recovery for calcium and sodium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Strontium was observed in the CCB above the reporting limit. Associated samples which exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis.

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H120447 (1): A04MW602D0001 DISSOLVED
F1H120447 (2): A04MW702DD0001 DISSOLVED
F1H120447 (3): A03AMW13D0001 DISSOLVED
F1H120447 (4): A04DMW708DD0001 DISSOLVED
F1H120447 (5): A04DMW9002 DISSOLVED
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Chloride (MCAWW 300.0A)

Batch: 1224148
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Fluoride (MCAWW 300.0A)

Batch: 1224149
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Sulfate (MCAWW 300.0A)

Batch: 1224153
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Nitrite as N (MCAWW 300.0A)

Batch: 1224151
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1224152
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)
There was insufficient sample provided to perform the sample duplicate, an LCS duplicate was used instead.

Affected Samples:
F1H120447 (1): A04MW602D0001 DISSOLVED
F1H120447 (2): A04MW702DD0001 DISSOLVED
F1H120447 (3): A03AMW13D0001 DISSOLVED
F1H120447 (4): A04DMW708DD0001 DISSOLVED
F1H120447 (5): A04DMW9002 DISSOLVED
F1H120447 (6): A04MW602D0001
F1H120447 (7): A04MW702DD0001
F1H120447 (8): A03AMW13D0001
F1H120447 (9): A04DMW708DD0001
F1H120447 (10): A04DMW9002

There was insufficient sample provided to perform the analysis at the method specified amount. A reduced sample amount was prepared. Count times were adjusted accordingly to meet client reporting limits. The Uranium reporting limit was achieved without adjustment to the count time.

Affected Samples:
F1H120447 (1): A04MW602D0001 DISSOLVED

Total Dissolved Solids (MCAWW 160.1)
The samples were analyzed at a dilution based on high concentrations of target analytes. The reporting limit has been adjusted accordingly.

Affected Samples:
F1H120447 (7): A04MW702DD0001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Case Narrative
LOT NUMBER: F1H130407

This report contains the analytical results for the 10 samples received under chain of custody by TestAmerica in St. Louis on August 13, 2011. These samples are associated with your Guteryl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1230199
Tertahydrofuran was removed from the initial calibration lowest point due to poor response. Isobutanol, n-Butanol, 2-Chloroethylvinyl ether, 4-Methyl-2-pentanone and 2-Hexanone were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration. The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

There was insufficient sample volume to perform MS/MSD analysis. An LCS/LCSD was performed to demonstrate accuracy and replicate precision.

The samples were analyzed at a dilution due to high concentrations of target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

The sample surrogate recovery is outside established QC limits. This excursion is attributed to a matrix interference which is physically evident in the sample. These samples foamed at the 1X and at a 5X dilution. The samples are reported at 5X as the lowest RL. The samples were also analyzed at a 50X dilution for analytes with high concentrations. The original analysis had similar surrogate failures.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (5): A04BMW9003

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1227139
The MS (MSD) recovery for calcium and sodium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery. No further action is required.

Strontium was observed in the CCB above the reporting limit. Associated samples which exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis. Original results are reported.

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003
F1H130407 (6): A04BMW250001 DISSOLVED
F1H130407 (7): A02MW060001 DISSOLVED
F1H130407 (8): A02MW100001 DISSOLVED
F1H130407 (9): A02MW070001 DISSOLVED
F1H130407 (10): A04BMW9003 DISSOLVED

Nitrite as N (MCAWW 300.0A)

Batch: 1227060
The following samples were reported ND at dilution for Nitrite, due to interference with Chloride in the undiluted runs. The reporting limit has been adjusted only for those targets reported from the dilution run.

The samples were received in hold on 8/13/11 for IC analysis, but were re-run out of 48 hour hold for Nitrite in batch 1227060 on 8/15/11, due to a failed bracketing CCV in the 8/13/11 in-hold run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003

Chloride (MCAWW 300.0A)

Batch: 1227179
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for chloride are attributed to matrix interference.

The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003

Fluoride (MCAWW 300.0A)

Batch: 1225019
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (5): A04BMW9003

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1225022
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003

Sulfate (MCAWW 300.0A)

Batch: 1230226
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003

Total Dissolvee Solids (MCAWW 160.1)
The samples were analyzed at a dilution based on high concentrations of target analytes. The reporting limit has been adjusted accordingly.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (5): A04BMW9003

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)
There was insufficient sample provided to perform the sample duplicate, an LCS duplicate was used instead.

Affected Samples:
F1H130407 (1): A04BMW250001
F1H130407 (2): A02MW060001
F1H130407 (3): A02MW100001
F1H130407 (4): A02MW070001
F1H130407 (5): A04BMW9003
F1H130407 (6): A04BMW250001 DISSOLVED
F1H130407 (7): A02MW060001 DISSOLVED
F1H130407 (8): A02MW100001 DISSOLVED
F1H130407 (9): A02MW070001 DISSOLVED
F1H130407 (10): A04BMW9003 DISSOLVED

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Case Narrative
LOT NUMBER: F1H160430

This report contains the analytical results for the six samples received under chain of custody by TestAmerica St. Louis on August 16, 2011. These samples are associated with your Guterl Steel project.

All applicable quality control procedures met method-specified acceptance criteria except as noted on the following page.

The test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica St. Louis. Any exceptions to NELAP requirements are noted in the case narrative. **TestAmerica St. Louis' Florida certification number is E87689.** The case narrative is an integral part of this report.

This report shall not be reproduced, except in full, without the written approval of the laboratory.

This report is incomplete without the case narrative. All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium, unless requested wet weight by the client.

Observations/Nonconformances

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1231041
Tertahydrofuran was removed from the initial calibration lowest point due to poor response. Isobutanol, n-Butanol, 2-Chloroethylvinyl ether, 4-Methyl-2-pentanone and 2-Hexanone were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration. The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (5): A04CMW711DD0001
F1H160430 (6): TRIP BLANK #1

The internal standard recoveries are within QC limits as compared to the IS limits set by the CCV for this 12 hour clock. However, the client requirement for DOD4.1 has the IS limits set to the mid-point of the ICAL as requested. The internal standard(s) recovery is outside the lower QC limit, indicating a potential positive bias. There were no target analytes associated with this internal standard observed above the reporting limit in the sample; therefore the sample data was not adversely affected by this excursion.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (6): TRIP BLANK #1

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1229104
Strontium was observed in the CCB above the acceptable QC limit (>3X MDL). Associated samples which are either non-detect for the contaminant or exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis.

Affected Samples:
F1H160430 (1): A04BMW706D0001 DISSOLVED
F1H160430 (3): A04BMW706D0001

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

The MS (MSD) recovery for calcium, magnesium and sodium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Affected Samples:
F1H160430 (1): A04BMW706D0001 DISSOLVED
F1H160430 (2): A04DMW710D0001 DISSOLVED
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001

Chloride (MCAWW 300.0A)

Batch: 1228144
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (5): A04CMW711DD0001

Fluoride (MCAWW 300.0A)

Batch: 1228145
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (3): A04BMW706D0001

The sample was reported ND at dilution, due to high concentrations of other analytes, which masked the retention times for these anions in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (5): A04CMW711DD0001

Sulfate (MCAWW 300.0A)

Batch: 1228149
The sampls was analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (5): A04CMW711DD0001

Nitrite as N (MCAWW 300.0A)

Batch: 1228147
The sample was reported ND at dilution, due to high concentrations of other analytes, which masked the retention times for these anions in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (5): A04CMW711DD0001

Phosphate as P, Ortho (MCAWW 300.0A)

Batch: 1228148
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001
F1H160430 (5): A04CMW711DD0001

The samples were reported ND at dilution, due to high concentrations of other analytes, which masked the retention times for these anions in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (5): A04CMW711DD0001

Total Dissolved Solids (MCAWW 160.1)
The samples were analyzed at a dilution based on high concentrations of target analytes. The reporting limit has been adjusted accordingly.

Affected Samples:
F1H160430 (3): A04BMW706D0001
F1H160430 (5): A04CMW711DD0001

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)
There was insufficient sample provided to perform the sample duplicate, an LCS duplicate was used instead.

Affected Samples:
F1H160430 (1): A04BMW706D0001 DISSOLVED
F1H160430 (2): A04DMW710D0001 DISSOLVED
F1H160430 (3): A04BMW706D0001
F1H160430 (4): A04DMW710D0001

There were no other nonconformances or observations noted with any analysis on this lot.

METHODS SUMMARY

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	(Y) N N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Case Narrative
LOT NUMBER: F1H170425

This report contains the analytical results for the 13 samples received under chain of custody by TestAmerica in St. Louis on August 17, 2011. These samples are associated with your Guterl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1231041
Tertahydrofuran was removed from the initial calibration lowest point due to poor response. Isobutanol, n-Butanol, 2-Chloroethylvinyl ether, 4-Methyl-2-pentanone and 2-Hexanone were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration. The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

The internal standard recoveries are within QC limits as compared to the IS limits set by the CCV for this 12 hour clock. However, the client requirement for DOD4.1 has the IS limits set to the mid-point of the ICAL as requested. The internal standard(s) recovery is outside the lower QC limit, indicating a potential positive bias. There were no target analytes associated with this internal standard observed above the reporting limit in the sample; therefore the sample data was not adversely affected by this excursion.

Affected Samples:
F1H170425 (7): A03MW606D0001
F1H170425 (13): TRIP BLANK #2

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1229104
Strontium was observed in the CCB above the acceptable QC limit (>3X MDL). Associated samples which are either non-detect for the contaminant or exhibit concentrations greater than ten (10) times the concentrations observed in the CCB, do not require re-analysis.

Affected Samples:
F1H170425 (12): A04CMW711DD0001

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted for the dilution.

The MS (MSD) recovery for calcium, magnesium, and sodium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

Affected Samples:
F1H170425 (1): A03MW606D0001 DISSOLVED
F1H170425 (2): A03MW14D0001 DISSOLVED
F1H170425 (3): A03MW606DR0001 DISSOLVED

F1H170425 (5): A03MW17D0001 DISSOLVED
F1H170425 (6): A04CMW711DD0001 DISSOLVED
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001
F1H170425 (11): A03MW17D0001
F1H170425 (12): A04CMW711DD0001

Chloride (MCAWW 300.0A)

Batch: 1229091
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001
F1H170425 (11): A03MW17D0001

Fluoride (MCAWW 300.0A)

Batch: 1329092
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001

Nitrite (MCAWW 300.0A)

Batch: 1229094
The following samples were reported ND at dilution for Nitrite, due to a matrix interference with Chloride, which masked the Nitrite retention time in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for are attributed to matrix interference.

Affected Samples:
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001
F1H170425 (11): A03MW17D0001

Orthophosphate as P (MCAWW 300.0A)

Batch: 1229095
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Ortho Phos are attributed to matrix interference.

Affected Samples:
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001
F1H170425 (11): A03MW17D0001

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)
There was insufficient sample provided to perform the sample duplicate, an LCS duplicate was used instead.

Affected Samples:
F1H170425 (1): A03MW606D0001 DISSOLVED
F1H170425 (2): A03MW14D0001 DISSOLVED
F1H170425 (3): A03MW606DR0001 DISSOLVED
F1H170425 (4): A03MW15D0001 DISSOLVED
F1H170425 (5): A03MW17D0001 DISSOLVED
F1H170425 (6): A04CMW711DD0001 DISSOLVED
F1H170425 (7): A03MW606D0001
F1H170425 (8): A03MW14D0001
F1H170425 (9): A03MW606DR0001
F1H170425 (10): A03MW15D0001
F1H170425 (11): A03MW17D0001
F1H170425 (12): A04CMW711DD0001

The Uranium samples have tracer recoveries below the 30% QC limit. The samples were re-extracted. The re-extracted samples results will be reported with this narrative.

Affected Samples:
F1H170425 (2): A03MW14D0001 DISSOLVED
F1H170425 (6): A04CMW711DD0001 DISSOLVED
F1H170425 (11): A03MW17D0001

The reporting limit for Uranium was not met due to reduced tracer recovery. The tracer recovery is within acceptance criteria. Analytical results are reported.

Affected Samples:
F1H170425 (3): A03MW606DR0001 DISSOLVED
F1H170425 (12): A04CMW711DD0001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Shipping Information

Shipper: (FedEx) UPS DHL Courier Client Other: _____ Multiple Packages: (Y) N

Shipping # (s):*				Sample Temperature (s):**			
1.	4855 0258 4330	6.		1.	↑	6.	
2.	4329	7.		2.	ambient	7.	
3.	4318	8.		3.	3	8.	
4.		9.		4.		9.	
5.		10.		5.		10.	

*Numbered shipping lines correspond to Numbered Sample Temp lines

**Sample must be received at 4°C ± 2°C- If not, note contents below. Temperature variance does NOT affect the following: Metals-Liquid; Rad tests- Liquid or Solids; Perchlorate

Condition (Circle "Y" for yes, "N" for no and "N/A" for not applicable):

1.	(Y) N	Are there custody seals present on the cooler?	8.	Y (N)	Are there custody seals present on bottles?
2.	Y (N) N/A	Do custody seals on cooler appear to be tampered with?	9.	Y N (N/A)	Do custody seals on bottles appear to be tampered with?
3.	(Y) N	Were contents of cooler frisked after opening, but before unpacking?	10.	(Y) N N/A	Was sample received with proper pH[1]? (If not, make note below)
4.	(Y) N	Sample received with Chain of Custody?	11.	Y N (N/A)	Containers for C-14, H-3 & I-129/131 marked with "Do Not Preserve" label?
5.	Y (N) N/A	Does the Chain of Custody match sample ID's on the container(s)?	12.	(Y) N	Sample received in proper containers?
6.	Y (N)	Was sample received broken?	13.	Y (N) N/A	Headspace in VOA or TOX liquid samples? (If Yes, note sample ID's below)
7.	(Y) N	Is sample volume sufficient for analysis?	14.	Y N (N/A)	Was Internal COC/Workshare received?

[1] For DOE-AL (Pantex, LANL, Sandia) sites, pH of ALL containers received must be verified, EXCEPT VOA, TOX, Oil & Grease and soils.

Notes:

second sample - labels have ms "D"
4th
5th

perf logged per chain.

Corrective Action:

☐ Client Contact Name: _____ Informed by: _____

☐ Sample(s) processed "as is"

☐ Sample(s) on hold until: _____ If released, notify: _____

Project Management Review: _____ Date: 8/18/11

THIS FORM MUST BE COMPLETED AT THE TIME THE ITEMS ARE BEING CHECKED IN. IF ANY ITEM IS COMPLETED BY SOMEONE OTHER THAN THE INITIATOR, THEN THAT PERSON IS REQUIRED TO APPLY THEIR INITIAL AND THE DATE NEXT TO THAT ITEM.

Case Narrative
LOT NUMBER: F1H190431

This report contains the analytical results for the 14 samples received under chain of custody by TestAmerica in St. Louis on August 19, 2011. These samples are associated with your Guterl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1237141
The CCV recovery was outside the upper QC limit (greater than 20% D) for Vinyl acetate, Carbon Tetrachloride, 1,1,2,2-Tetrachloroethane, sec-Butylbenzene, Nonanal and 1,2-Dibromo-3-chlopropane indicating a potential high bias for those analytes in the samples associated with this CCV. These analytes were not detected above the reporting limit or were not target analytes in the associated samples.

The CCV recoveries are outside the lower QC limit (greater than 20% D) for Naphthalene indicating a potential low bias for those analytes in the samples associated with this CCV. This analyte is not a target analytes in the associated samples.

The LCS recovery for 1,1,2,2-Tetrachloroethane is outside the upper QC limit, indicating a potential positive bias for that analytes. This analyte was not observed above the reporting limit in the associated samples; therefore the sample data was not adversely affected by this excursion.

The MS ans MSD recoveries for 1,1,2,2-Tetrachloroethane are outside the upper QC limit, indicating a potential positive bias for that analytes. These analytes were not observed above the reporting limit in the associated samples; therefore the sample data was not adversely affected by this excursion.

The MSD recovery for 1,1,1-Trichloroethane, 1,2-Dichloroethene and 1,2-Dichloroethene (total) are outside the established QC limits. The RPD is within method acceptance criteria indicating matrix interference. Method performance is demonstrated by acceptable LCS recovery.

Affected Samples:
F1H190431 (7): A04DMW710DD0001
F1H190431 (8): A04DFB710DD0001
F1H190431 (9): A04DMW712DD0001
F1H190431 (10): A04BMW707DD0001
F1H190431 (14): TRIP BLANK #3

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1234136
The MS and MSD recoveries for calcium and sodium are outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H190431 (1): A04DMW710DD0001 DISSOLVED
F1H190431 (2): A04DFB710DD0001 DISSOLVED
F1H190431 (3): A04DMW712DD0001 DISSOLVED
F1H190431 (4): A04AMW610D0001 DISSOLVED

F1H190431 (13): A04AMW210001

Chloride (MCAWW 300.0A)

Batch: 1231100
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H190431 (7): A04DMW710DD0001
F1H190431 (9): A04DMW712DD0001
F1H190431 (11): A04AMW610D0001
F1H190431 (12): A04AMW200001
F1H190431 (13): A04AMW210001

Sulfate (MCAWW 300.0A)

Batch: 1231105
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H190431 (7): A04DMW710DD0001
F1H190431 (9): A04DMW712DD0001
F1H190431 (11): A04AMW610D0001
F1H190431 (12): A04AMW200001
F1H190431 (13): A04AMW210001

Nitrate (MCAWW 300.0A)

Batch: 1231102
The following samples were analyzed at dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H190431 (12): A04AMW200001

Nitrite (MCAWW 300.0A)

Batch: 1231103
The following samples were reported ND at dilution for Nitrite, due to high concentrations of Chloride, which masked the retention time for Nitrite in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H190431 (9): A04DMW712DD0001
F1H190431 (11): A04AMW610D0001
F1H190431 (12): A04AMW200001
F1H190431 (13): A04AMW210001

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H190431 (7): A04DMW710DD0001
F1H190431 (8): A04DFB710DD0001
F1H190431 (9): A04DMW712DD0001
F1H190431 (11): A04AMW610D0001
F1H190431 (12): A04AMW200001
F1H190431 (13): A04AMW210001

Orthophosphate (MCAWW 033.0A)

Batch: 1231104
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries Ortho Phos in batch are attributed to matrix interference.

Affected Samples:
F1H190431 (7): A04DMW710DD0001
F1H190431 (8): A04DFB710DD0001
F1H190431 (9): A04DMW712DD0001

There were no other nonconformances or observations noted with any analysis on this lot.

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

METHODS SUMMARY

F1H190431

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Alkalinity	MCAWW 310.1	MCAWW 310.1
Chloride	MCAWW 300.0A	MCAWW 300.0A
Filterable Residue (TDS)	MCAWW 160.1	MCAWW 160.1
Fluoride	MCAWW 300.0A	MCAWW 300.0A
Isotopic Uranium by Alpha Spectroscopy	EML A-01-R MOD

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Case Narrative
LOT NUMBER: F1H230407

This report contains the analytical results for the nine samples received under chain of custody by TestAmerica in St. Louis on August 23, 2011. These samples are associated with your Guterl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.1 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances

The coolers were received from 2-6° C. No observations or non-conformances were noted at the time of receipt.

Volatile Organics by GC/MS (SW-846 8260)

Batch: 1237192
The CCV recoveries are outside the upper QC limit (greater than 20% D) for Bromomethane, Chloroethane, Trichlorofluoromethane and 1,2,3-Trichloropropane indicating a potential high bias for those analytes in the samples associated with this CCV. These analytes were not detected above the reporting limit or were not target analytes in the associated samples.

The LCS recovery for Bromomethane is outside the upper QC limit, indicating a potential positive bias for this analyte. This analyte was not observed above the reporting limit in the associated samples; therefore the sample data was not adversely affected by this excursion.

Affected Samples:
F1H230407 (5): TRIP BLANK #5
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

The samples were analyzed at a dilution based upon laboratory screening information. The reporting limit has been adjusted for the dilution.

Affected Samples:
F1H230407 (7): A02MW50001

Batch: 124401
The MS/MSD analysis was not performed with this batch; the associated samples are dilutions only. The MS/MSD was performed with original analyses. An LCS/LCSD was performed to demonstrate accuracy and replicate precision.

The samples were analyzed at a dilution due to high concentrations of target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

The %RSD for Ethyl acetate exceeds the acceptance criteria. The analyte will not be reported from this ICAL.

The following compounds were removed from the initial calibration lowest point due to poor response. Ethyl ether, Methyl acetate, Acetontrile, Ethyl acetate, 2-Butanone, Isobutanol, 1,4-dioxane, 2-Nitropropane and Cyclohexanone. Addtionally, Acetone was removed from the lowest 2 points.

n-Propylbenzene and sec-Butylbenzene were removed from the initial calibration highest point due to elevated response. Additionally, the surrogate compounds (Dibromofluoromethane, 1,2-Dichloroethane-d4, Toluene-d8 and 4-Bromofluorobenzene) were not spiked at the initial calibration highest point because the recoveries do not warrant the high concentration.

The initial calibration still meets the minimum number of points and the reporting limits required. The compounds were removed within TestAmerica's selection of points policy.

Affected Samples:
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001

Inductively Coupled Plasma (ICP) Metals (SW-846 6010)

Batch: 1236078
There was insufficient digestate volume for the analysis of thallium. The samples were re-prepared and the re-extract batch is 1242041.

The samples were analyzed at a dilution due to high concentrations of target and interfering analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

The serial dilution for sodium is outside of method acceptance criteria indicating matrix interference. All associated samples are flagged accordingly.

1236078-F1H230407-007
The MS (MSD) recovery for calcium is outside the established QC limits. The said analyte concentration in the original sample is greater than four times the amount spiked, making percent recovery information ineffective. Method performance is demonstrated by acceptable LCS recovery.

1236078-F1H230407-002
The MS (MSD) recovery for strontium is outside the established QC limits. The RPD is within method acceptance criteria indicating matrix interference. Method performance is demonstrated by acceptable LCS recovery.

Affected Samples:
F1H230407 (1): A02MW600D0001 DISSOLVED
F1H230407 (2): A02MW50001 DISSOLVED
F1H230407 (3): A02MW120001 DISSOLVED
F1H230407 (4): A02MW30001 DISSOLVED
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

The concentration of strontium in the CCB is greater than 2 times the MDL. The samples associated with this CCB exhibit concentrations greater than ten times the concentrations observed in the CCB.

Affected Samples:
F1H230407 (7): A02MW50001
F1H230407 (9): A02MW30001

Chloride (MCAWW 300.0A)

Batch: 1235141
The following samples were analyzed at a dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (9): A02MW30001

Nitrate (MCAWW 300.0A)

Batch: 1235143
The following samples were analyzed at a dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (9): A02MW30001

Sulfate (MCAWW 300.0A)

Batch: 1235146
The following samples were analyzed at a dilution, due to high concentrations of the target analytes. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

Fluoride (MCAWW 300.0A)

Batch: 1235142
The following samples were reported ND at a dilution, due to matrix interferences, which masked the target retention times in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

Affected Samples:
F1H230407 (6): A02M600D0001

Nitrite (MCAWW 300.0A)

Batch: 1235144
The following samples were reported ND at a dilution, due to matrix interferences, which masked the target retention times in the undiluted analyses. The reporting limit has been adjusted only for those targets reported from the dilution run.

The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

Orthophosphate as P (MCAWW 300.0A)

Batch: 1235145
The anion matrix spike solution contains all routine anions. Spiking technique, sample preparation and method compliance is demonstrated by the remaining acceptable MS recoveries. Poor matrix spike recoveries for Nitrite are attributed to matrix interference.

Affected Samples:
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

Filteralbe residue (TDS) (MCAWW 160.1)

Batch: 1238124
The sample was analyzed at a dilution based on high concentrations of target analytes. The reporting limit has been adjusted accordingly.

Affected Samples:
F1H230407 (6): A02M600D0001

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)
There was insufficient sample to perform the sample duplicate.

Affected Samples:
F1H230407 (1): A02MW600D0001 DISSOLVED
F1H230407 (2): A02MW50001 DISSOLVED
F1H230407 (3): A02MW120001 DISSOLVED
F1H230407 (4): A02MW30001 DISSOLVED
F1H230407 (6): A02M600D0001
F1H230407 (7): A02MW50001
F1H230407 (8): A02MW120001
F1H230407 (9): A02MW30001

Manual Integration:
Manual integration may have been preformed for certain analysis and/or samples. Raw sample data can be supplied upon request detailing the manual integration and reasons why.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Copper	ND	25	ug/L	SW846 6010C	08/24-08/28/11	MLW8C1AM
		Dilution Factor: 1		Analysis Time..: 01:17		
Iron	**322**	**100**	**ug/L**	**SW846 6010C**	**08/24-08/28/11**	**MLW8C1AN**
		Dilution Factor: 1		Analysis Time..: 01:17		
Magnesium	**149000**	**10000**	**ug/L**	**SW846 6010C**	**08/24-08/27/11**	**MLW8C1AP**
		Dilution Factor: 10		Analysis Time..: 18:11

Shaw Environmental & Infrastructure Inc

Client Sample ID: A02MW600D0001 DISSOLVED

TOTAL Metals

Lot-Sample #...: F1H230407-001 Matrix.....: WATER

PARAMETER	RESULT	REPORTING LIMIT	UNITS	METHOD	PREPARATION-ANALYSIS DATE	WORK ORDER #
Manganese	**353**	**15**	**ug/L**	**SW846 6010C**	**08/24-08/28/11**	**MLW8C1AQ**
		Dilution Factor: 1		Analysis Time..: 01:17		
Sodium	**1840000 E**	**50000**	**ug/L**	**SW846 6010C**	**08/24-08/30/11**	**MLW8C1AR**
		Dilution Factor: 50		Analysis Time..: 15:10		
Nickel	ND	40	ug/L	SW846 6010C	08/24-08/28/11	MLW8C1AT
		Dilution Factor: 1		Analysis Time..: 01:17		
Lead	**1.5 J**	**10**	**ug/L**	**SW846 6010C**	**08/24-08/28/11**	**MLW8C1AU**
		Dilution Factor: 1		Analysis Time..: 01:17		
Antimony	ND	10	ug/L	SW846 6010C	08/24-08/28/11	MLW8C1AV
		Dilution Factor: 1		Analysis Time..: 01:17		
Selenium	ND	15	ug/L	SW846 6010C	08/24-08/28/11	MLW8C1AW
		Dilution Factor: 1		Analysis Time..: 01:17		
Strontium	**1340 N**	**50**	**ug/L**	**SW846 6010C**	**08/24-08/30/11**	**MLW8C1AX**
		Dilution Factor: 10		Analysis Time..: 13:29		
Vanadium	ND	50	ug/L	SW846 6010C	08/24-08/28/11	MLW8C1A1
		Dilution Factor: 1		Analysis Time..: 01:17		
Zinc	**611**	**20**	**ug/L**	**SW846 6010C**	**08/24-08/28/11**	**MLW8C1A2**
		Dilution Factor: 1		Analysis Time..: 01:17		
Prep Batch #...: 1242041						
Thallium	ND	20	ug/L	SW846 6010C	08/29-08/31/11	MLW8C2A0
