Acquisition

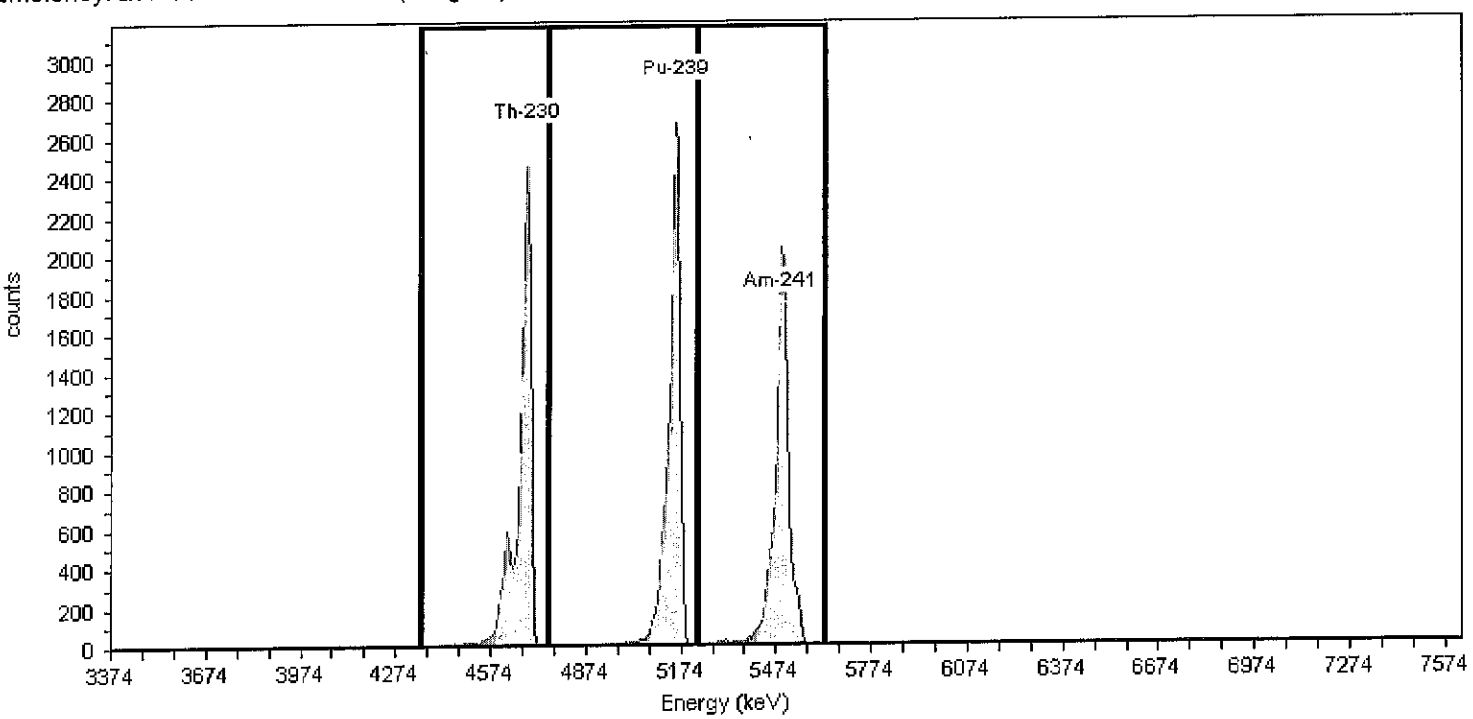
Detector: AV48 , SN: 50-051JJ4
Acquisition Start Date: 6/20/2011 3:50:19AM
Live Time: 140.00 min.
Real Time: 140.05 min.
Efficiency: 27.48% +/- 0.37% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,675.00	97.68
Pu-239	240	5.16	186	249	14,590.00	104.21
Am-241	284	5.49	249	303	13,061.00	93.29

Calibration

Sample Name: May2012_AV48
Description:
Detector: AV48

Calibration Date: 5/3/2012 9:38:16AM
Analyst: 60040

Source Info

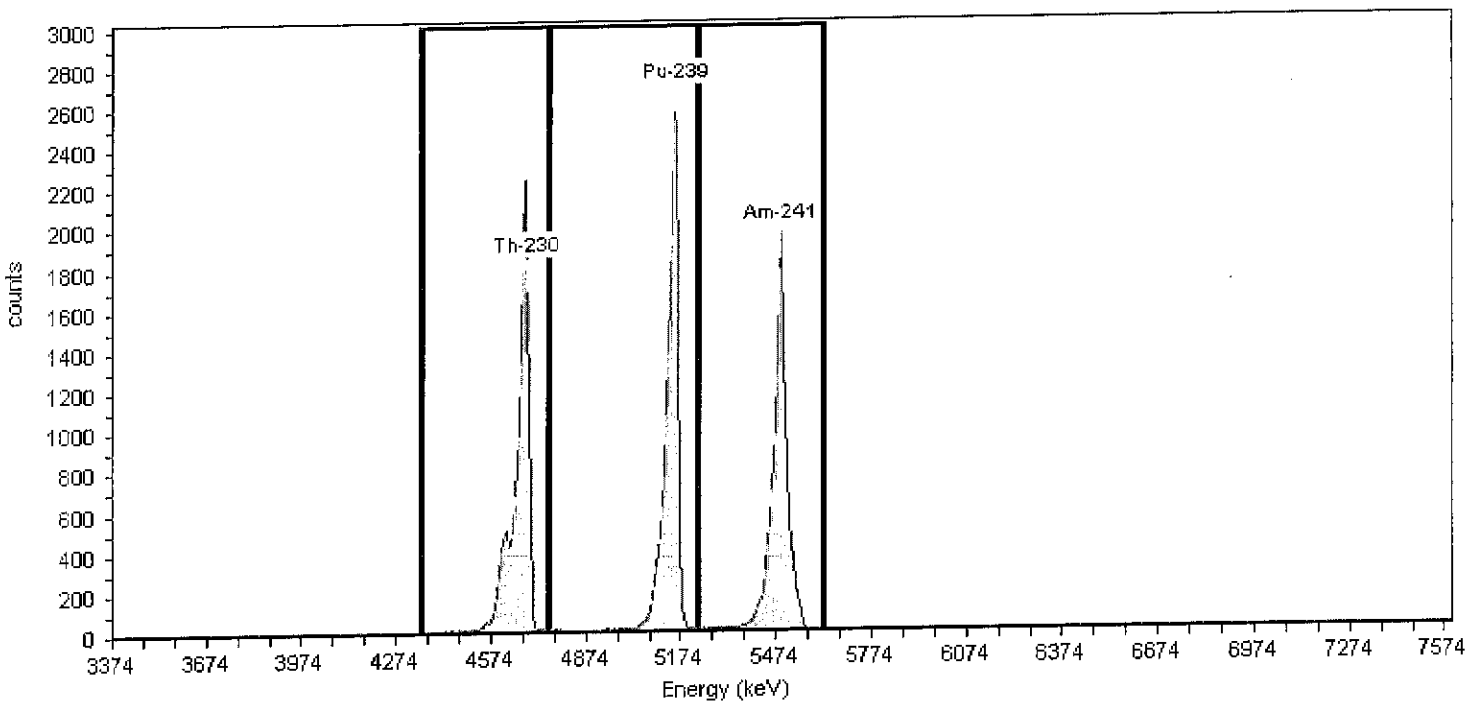
Certificate ID: 82237-334
Prepared by: Analytics

Certification Date: 6/1/2010 12:00:00PM
Description:

Acquisition

Detector: AV48 , SN: 50-051JJ4
Acquisition Start Date: 5/2/2012 11:00:36PM
Live Time: 140.00 min.
Real Time: 140.43 min.
Efficiency: 27.25% +/- 0.37% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,222.00	94.44
Pu-239	240	5.16	186	249	14,804.00	105.74
Am-241	284	5.49	249	303	12,886.00	92.04

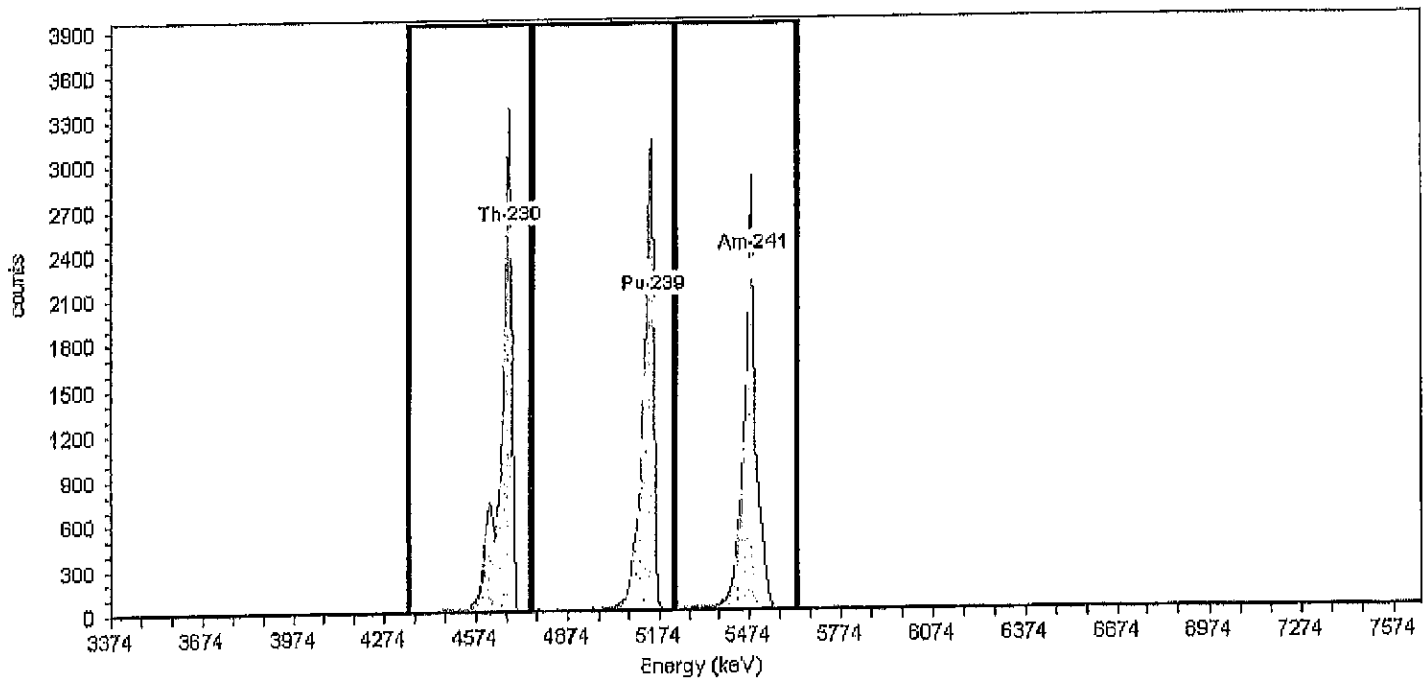
Certification Date: 6/3/2010 12:00:00PM
Description:

Acquisition

Detector: AV50 , SN: 50-060W2
Acquisition Start Date: 2/23/2012 11:03:19PM
Live Time: 140.00 min.
Real Time: 140.06 min.
Efficiency: 28.22% +/- 0.31% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	18,073.00	129.09
Pu-239	240	5.16	186	249	17,064.00	121.89
Am-241	284	5.49	249	303	17,096.00	122.11

Calibration

Name: Feb2012_AV58a_ICV
Description:
Detector: AV58

Calibration Date: 2/24/2012 3:16:31PM
Analyst: 60040

Source Info

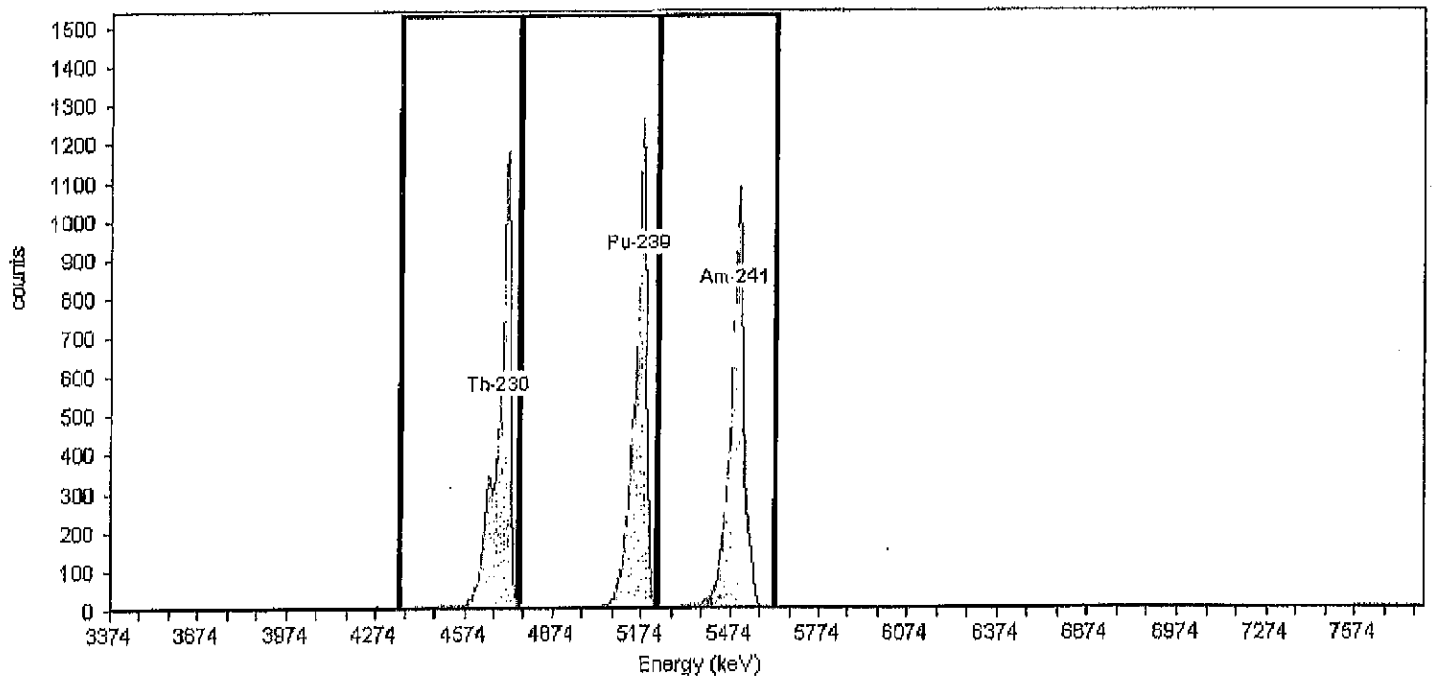
Certificate ID: 82232-334
Prepared by: Analytics

Certification Date: 6/3/2010 12:00:00PM
Description:

Acquisition

Detector: AV58 , SN: 48-158EE4
Acquisition Start Date: 2/24/2012 2:16:15PM
Live Time: 60.00 min.
Real Time: 60.01 min.
Efficiency: 28.63% +/- 0.43% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	7,831.00	130.52
Pu-239	240	5.16	186	249	7,354.00	122.57
Am-241	284	5.49	249	303	7,529.00	125.48

Calibration

Sample Name: May2012_AV48
Description:
Detector: AV48

Calibration Date: 5/3/2012 9:38:16AM
Analyst: 60040

Source Info

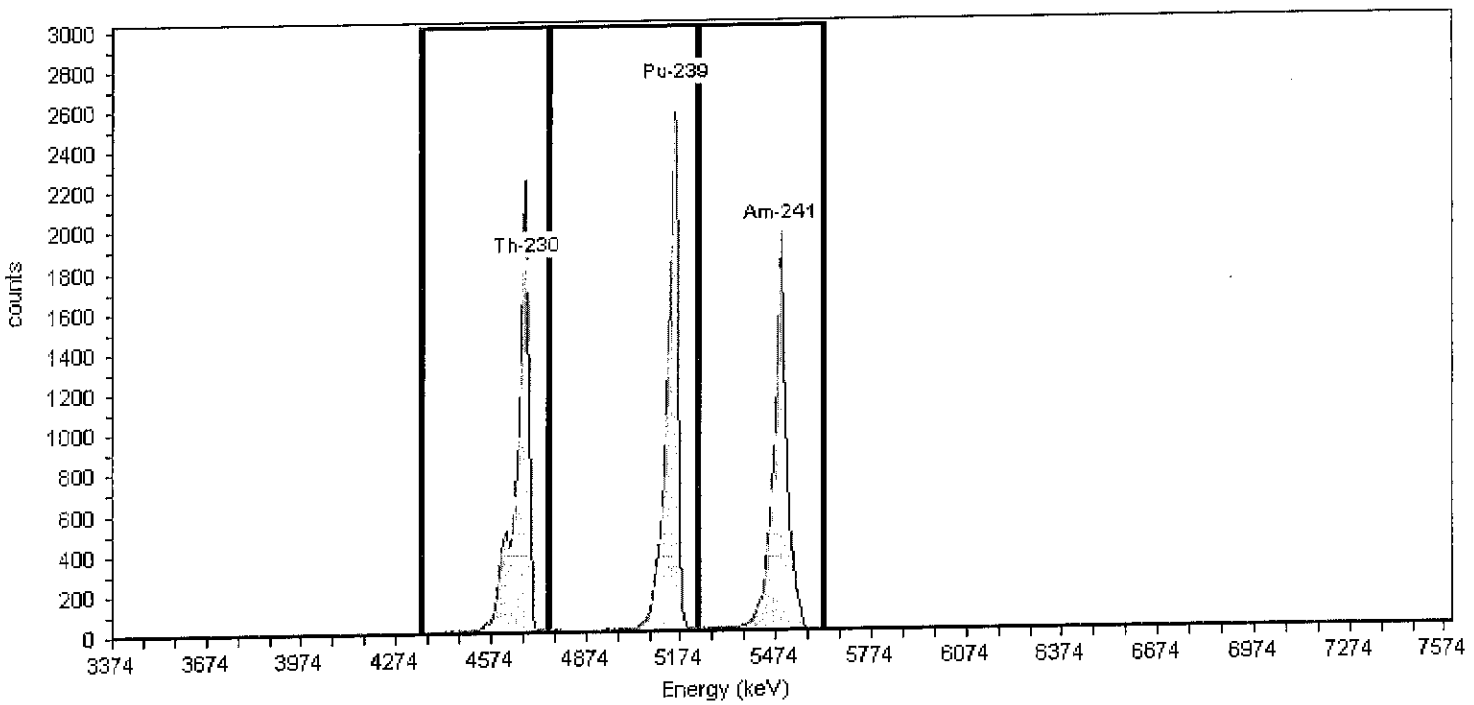
Certificate ID: 82237-334
Prepared by: Analytics

Certification Date: 6/1/2010 12:00:00PM
Description:

Acquisition

Detector: AV48 , SN: 50-051JJ4
Acquisition Start Date: 5/2/2012 11:00:36PM
Live Time: 140.00 min.
Real Time: 140.43 min.
Efficiency: 27.25% +/- 0.37% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,222.00	94.44
Pu-239	240	5.16	186	249	14,804.00	105.74
Am-241	284	5.49	249	303	12,886.00	92.04

Calibration

Name: May2011_AV60
Description:
Detector: AV60

Calibration Date: 6/2/2011 11:03:44AM
Analyst: 60040

Source Info

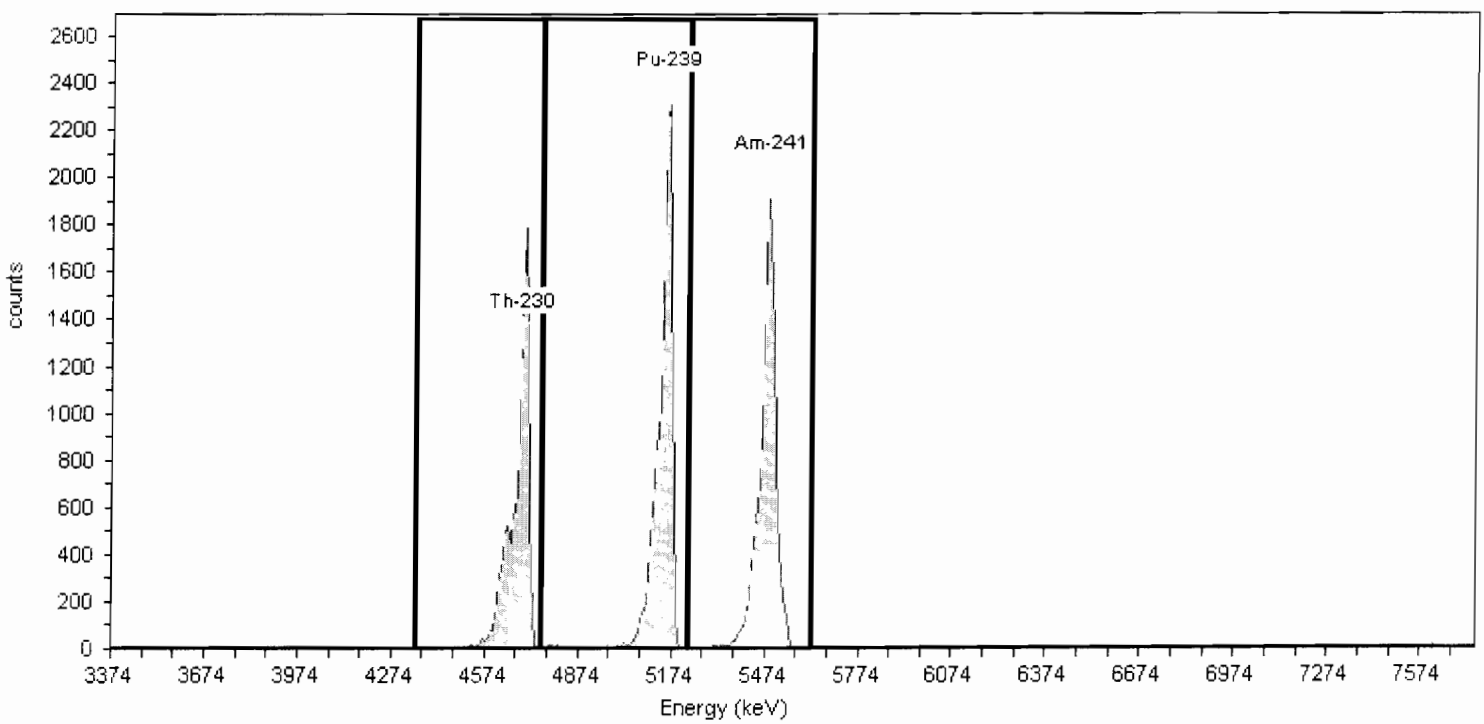
Certificate ID: 63507-334
Prepared by: Analytics

Certification Date: 5/30/2002 12:00:00PM
Description:

Acquisition

Detector: AV60 , SN:
Acquisition Start Date: 6/2/2011 8:26:19AM
Live Time: 140.00 min.
Real Time: 140.13 min.
Efficiency: 26.47% +/- 0.28% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	11,967.00	85.48
Pu-239	240	5.16	186	249	14,610.00	104.36
Am-241	284	5.49	249	303	13,828.00	98.77

Calibration

Name: May2011_AV68
Description:
Detector: AV68

Calibration Date: 2/21/2012 2:59:22PM
Analyst: 60040

Source Info

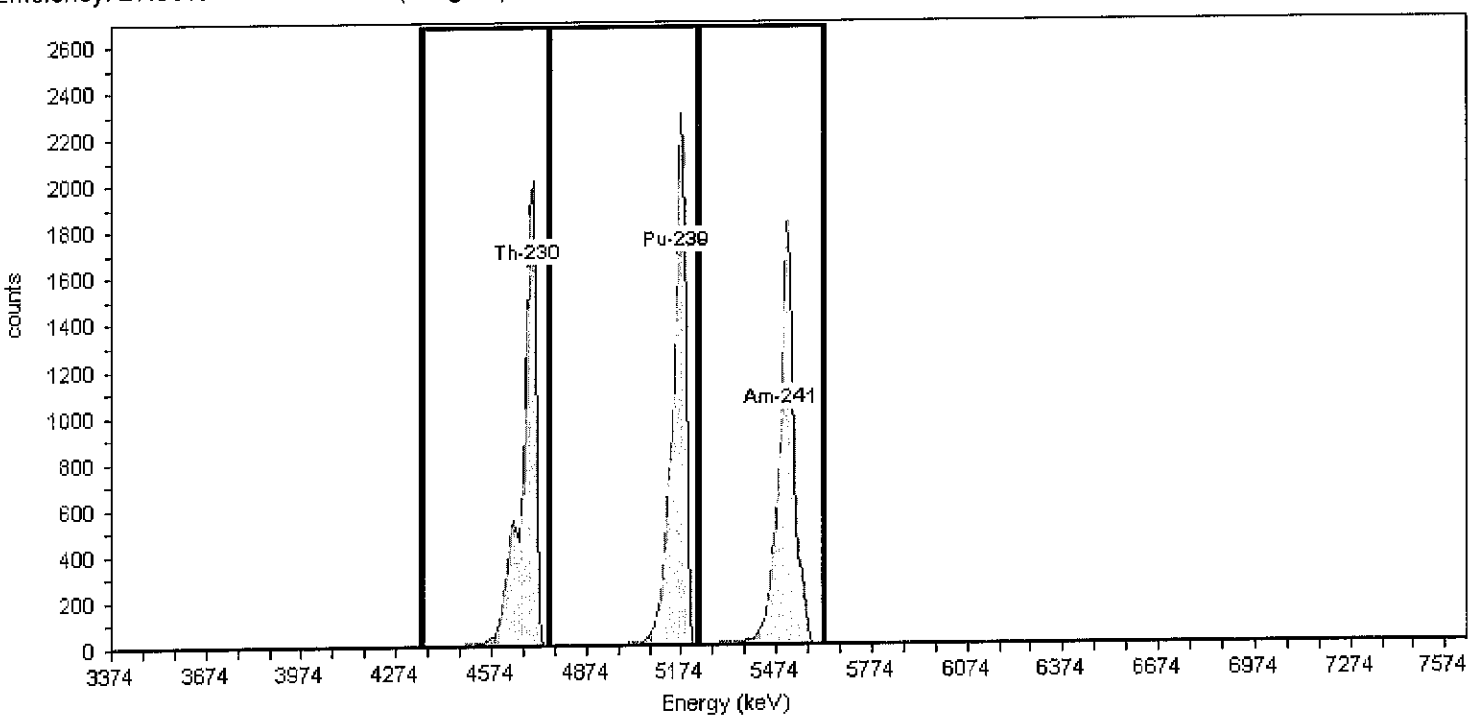
Certificate ID: 82237-334
Prepared by: Analytics

Certification Date: 6/1/2010 12:00:00PM
Description:

Acquisition

Detector: AV68 , SN: 48-45884
Acquisition Start Date: 6/2/2011 8:30:14AM
Live Time: 140.00 min.
Real Time: 140.09 min.
Efficiency: 27.33% +/- 0.37% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,526.00	96.61
Pu-239	240	5.16	186	249	14,535.00	103.82
Am-241	284	5.49	249	303	13,035.00	93.11

Calibration

Name: June2011_AV70
Description:
Detector: AV70

Calibration Date: 6/21/2011 2:26:58PM
Analyst: 60040

Source Info

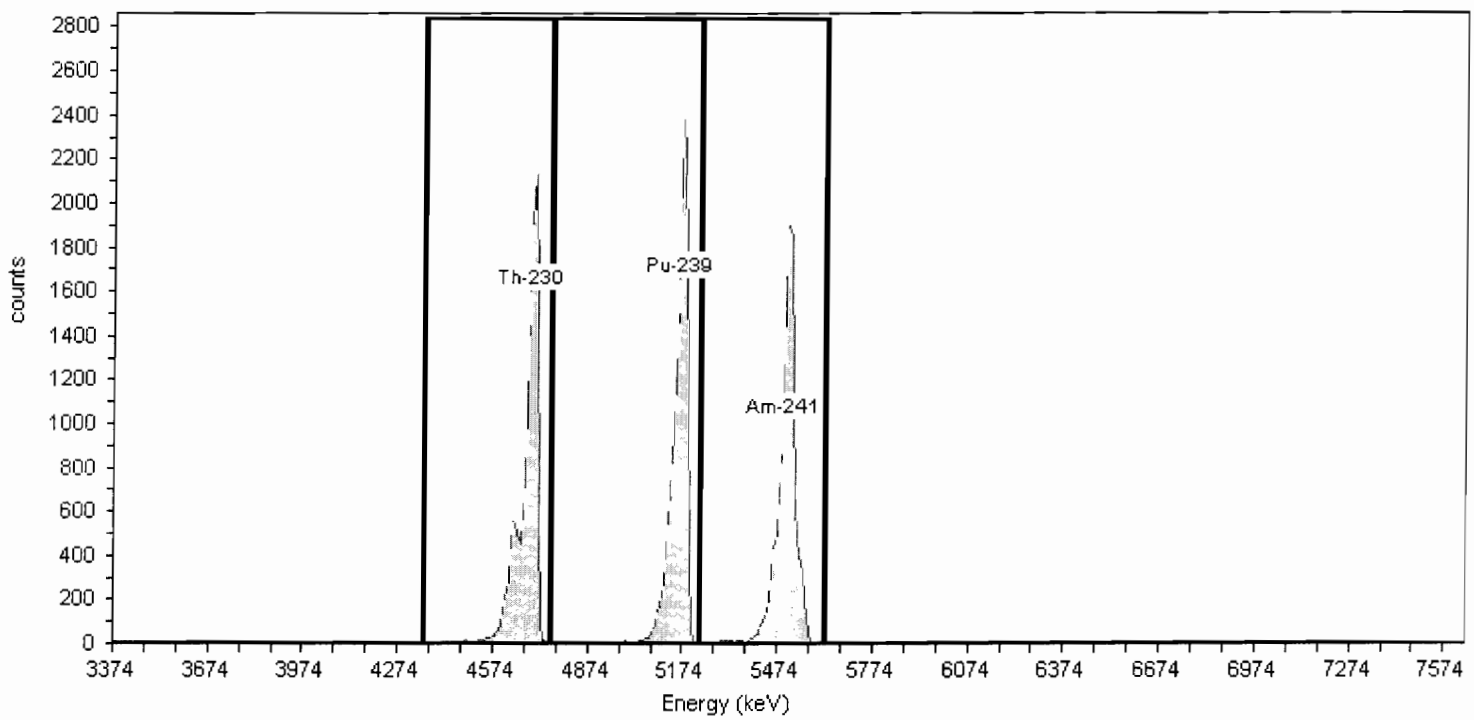
Certificate ID: 82239-334
Prepared by: Analytics

Certification Date: 6/2/2010 12:00:00PM
Description:

Acquisition

Detector: AV70 , SN: 48-158FF1
Acquisition Start Date: 6/21/2011 11:56:05AM
Live Time: 140.00 min.
Real Time: 140.45 min.
Efficiency: 27.63% +/- 0.39% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,271.00	94.79
Pu-239	240	5.16	186	249	14,176.00	101.26
Am-241	284	5.49	249	303	13,029.00	93.06

Acquisition

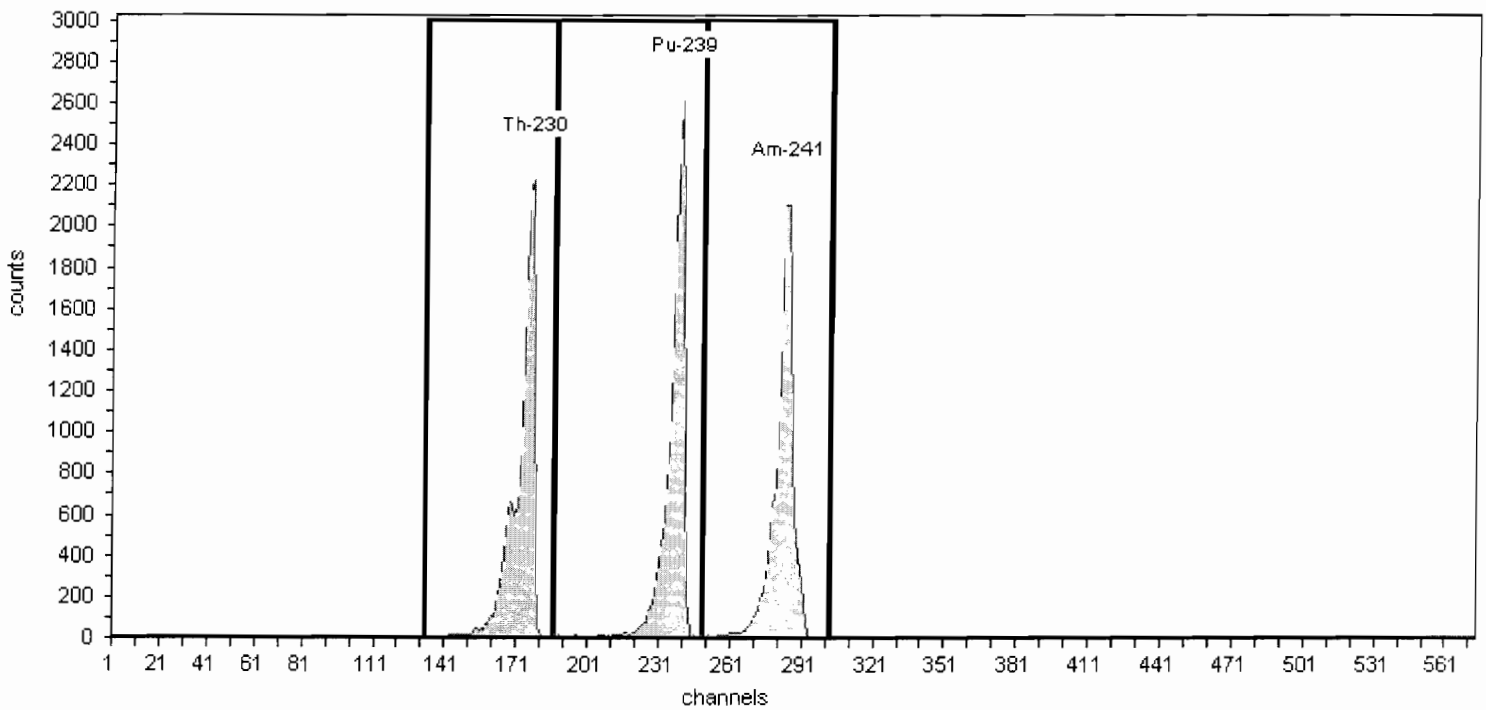
Detector: AV72 , SN:
Acquisition Start Date: 6/2/2011 8:31:21AM
Live Time: 140.00 min.
Real Time: 140.09 min.
Efficiency: 28.92% +/- 0.35% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	16,043.00	114.59

Calibration

Name: June2011_AV110
Description:
Detector: AV110

Calibration Date: 6/10/2011 2:51:15PM
Analyst: 60040

Source Info

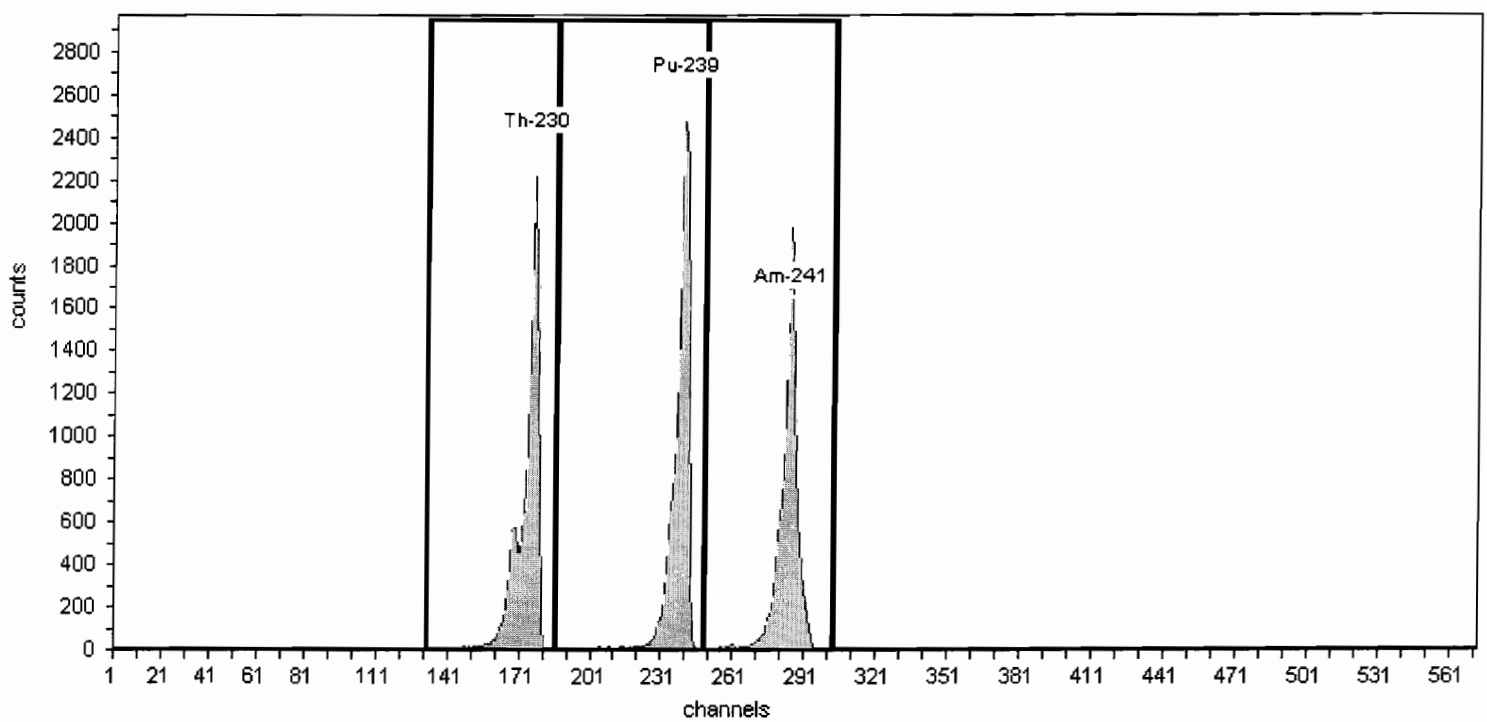
Certificate ID: 82239-334
Prepared by: Analytics

Certification Date: 6/2/2010 12:00:00PM
Description:

Acquisition

Detector: AV110 , SN: 49-034G5
Acquisition Start Date: 6/6/2011 8:27:23AM
Live Time: 140.00 min.
Real Time: 140.12 min.
Efficiency: 27.61% +/- 0.39% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	13,327.00	95.19
Pu-239	240	5.16	186	249	14,197.00	101.41
Am-241	284	5.49	249	303	12,925.00	92.32

Description:

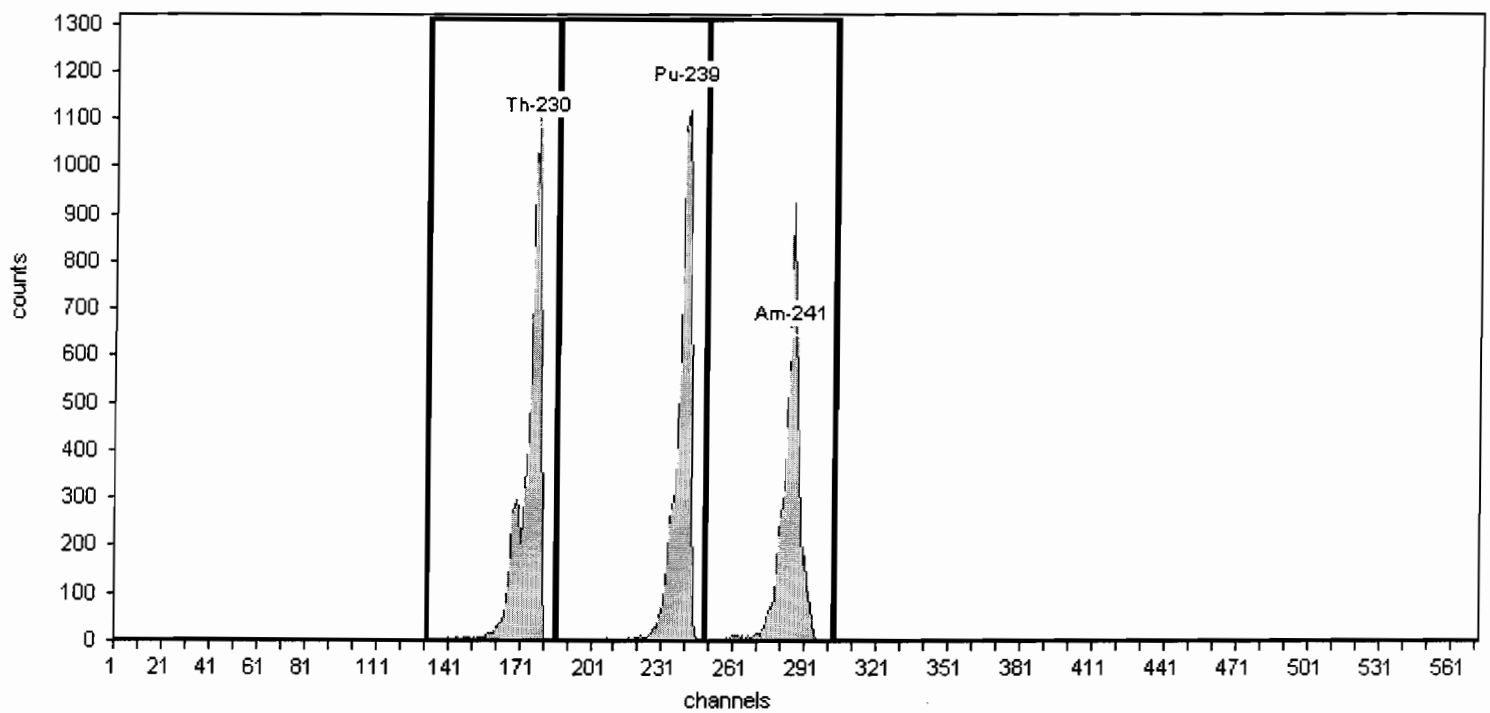
Acquisition

Detector: AV110 , SN: 49-034G5
Acquisition Start Date: 6/6/2011 1:16:05PM
Live Time: 60.00 min.
Real Time: 60.05 min.
Efficiency: 27.23% +/- 0.46% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	6,808.00	113.47
Pu-239	240	5.16	186	249	6,669.00	111.15

Calibration

Name: June2011_AV118_ICV
Description:
Detector: AV118

Calibration Date: 6/10/2011 2:55:36PM
Analyst: 60040

Source Info

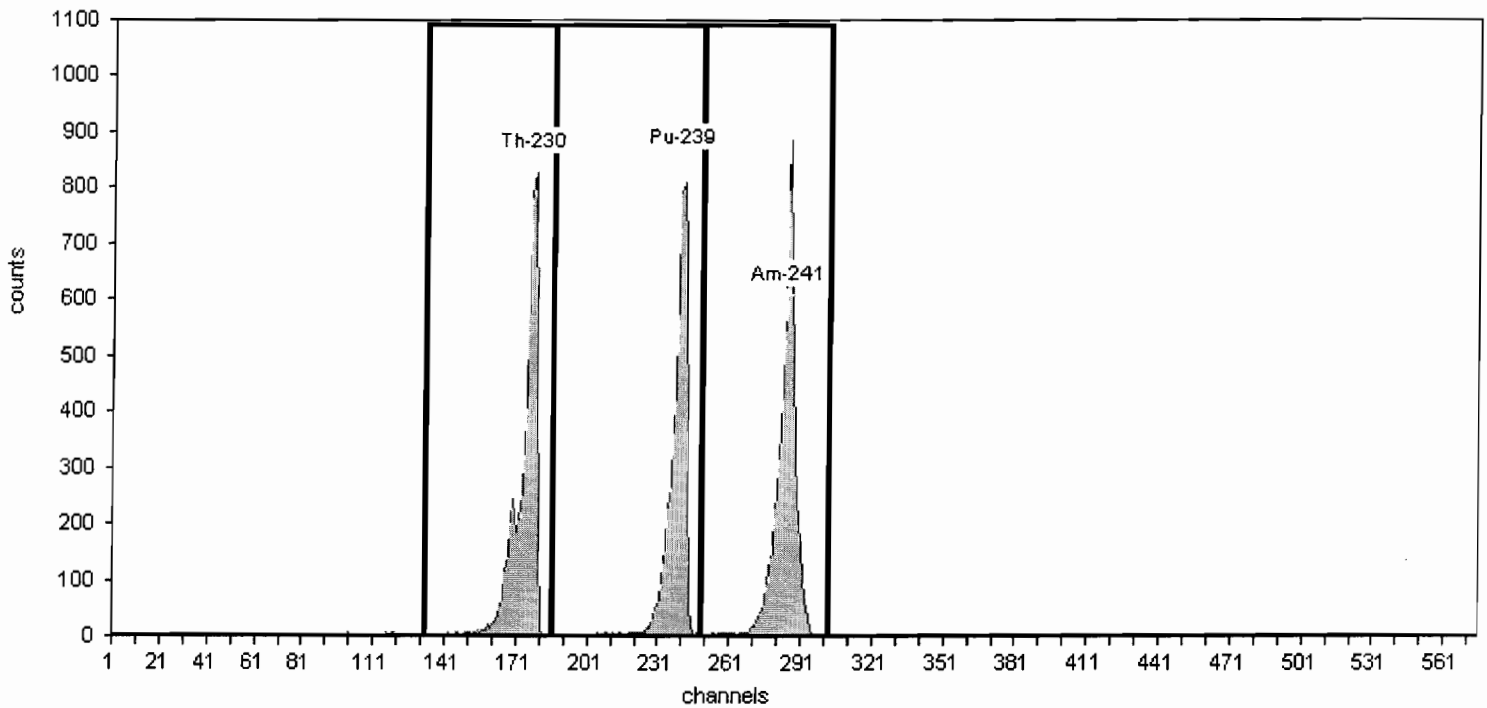
Certificate ID: 82246-334
Prepared by: Analytics

Certification Date: 6/9/2010 12:00:00PM
Description:

Acquisition

Detector: AV118 , SN: 49-037F4
Acquisition Start Date: 6/6/2011 1:18:06PM
Live Time: 60.00 min.
Real Time: 61.08 min.
Efficiency: 26.81% +/- 0.50% TPU(2 sigma)

Energy Calibration Equation:
Gain = 7.4575 keV / Ch
Offset = 3,366.95 keV
Quadratic = 0.0000 keV / Ch^2



General Analysis

Method: Manual (ROI)
Algorithm: Linear

Initial Calibration: No
Shelf: 1

Nuclide Activity Summary

Nuclide	Peak Channel	Peak Energy MeV	ROI Start Channel	ROI End Channel	Gross Counts	Net Count Rate (cpm)
Th-230	177	4.69	132	186	5,403.00	90.05
Pu-239	240	5.16	186	249	5,085.00	84.75
Am-241	284	5.49	249	303	5,842.00	97.37

Case Narrative
LOT NUMBER: F2J250431-

This report contains the analytical results for the 22 samples received under chain of custody by TestAmerica in St. Louis on October 25, 2012. These samples are associated with your Guterl Steel project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted on the following page.

The test results in this report meet all DoD QSM 4.2 requirements for which accreditations are held by TestAmerica in St. Louis except as permitted or accepted by the client and/or site specific documentation. In addition, the test results in this report meet all NELAP requirements for parameters in which accreditations are held by TestAmerica in St. Louis. **TestAmerica St. Louis' Florida certification number is E87689.** Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of this report.

All chemical analysis results are based upon sample as received, wet weight, unless noted otherwise. All radiochemistry results are based upon sample as dried and ground with the exception of tritium and carbon-14, unless requested wet weight by the client.

Observations/Nonconformances
Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Certification Statement:
I certify that this image, and all data packages produced from this image, accurately represent the data and is in compliance with the SAP requirements, both technically and for completeness, other than the conditions detailed above or in the sample data package case narrative. The data, contained in this electronic image and computer-readable EDD, have been authorized by the lab manager, or the manager's designee.

The following clean-up methods for Organic analyses may have been used on samples in this data set. Specific methods employed are documented on the batch extraction logs.

Method 3600C: Cleanup
Method 3620C: Florisil Cleanup
Method 3630C: Silica Gel Cleanup
Method 3640A: Gel-Permeation Cleanup
Method 3650B: Acid-Base Partition Cleanup
Method 3660B: Sulfur Cleanup
Method 3665A: Sulfuric Acid/Permanganate Cleanup

Isotopic Uranium by Alpha Spectroscopy (EML A-01-R MOD)

The sample aliquot was reduced due to high activity from historical data. The Uranium samples (F2J250431-010 and -011) did not meet the CRDL due to the samples high activity above the MDC.

Affected Samples:
F2J250431 (1): A04BMW704DD0005
F2J250431 (2): A04DMW710D0005
F2J250431 (3): A04DMW708DD0005
F2J250431 (4): A04DMW710DD0005
F2J250431 (5): A04DMW713D0005
F2J250431 (6): A04DMW604D0005
F2J250431 (7): DUPLICATE 03
F2J250431 (8): A04DMW709DD0005
F2J250431 (9): A04BMW707DD0005
F2J250431 (10): A04BMW605D0005
F2J250431 (11): A04BMW260005

The sample aliquot was reduced due to high activity from historical data. The Uranium spike recovery for F2J250431-007S and -007D are outside the upper control limit. The samples associated with the batch were re-extracted. The re-extracted Uranium samples (F2J250431-017S and -017D) have spike recoveries outside the upper control limit due to sample matrix interference.

Affected Samples:
F2J250431 (12): A04BMW704DD0005
F2J250431 (13): A04DMW710D0005
F2J250431 (14): A04DMW708DD0005
F2J250431 (15): A04DMW710DD0005
F2J250431 (16): A04DMW713D0005
F2J250431 (17): A04DMW604D0005
F2J250431 (18): DUPLICATE 03
F2J250431 (19): A04DMW709DD0005
F2J250431 (20): A04BMW707DD0005
F2J250431 (22): A04BMW260005

The sample aliquot was reduced due to high activity from historical data. There was also insufficient sample to perform the sample at the requested 1000mL. The Uranium sample (F2J250431-021) did not meet the CRDL due to the sample's high activity which is greater than the MDC.

Affected Samples:
F2J250431 (21): A04BMW605D0005

There were no other nonconformances or observations noted with any analysis on this lot.

METHODS SUMMARY

F2J250431

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Isotopic Uranium by Alpha Spectroscopy	EML A-01-R MOD	
ICP-MS (6020A)	SW846 6020A

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

DUP- Laboratory Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium and isotopic thorium analytical data from aqueous and sludge samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site (Lockport Sewer Locations).

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy (EML A-01-R-MOD), according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are Th-228, Th-230, Th-232, U-234, U-235 and U-238. The sludge sample results are reported on a dry weight basis.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	Initial Calibrations
	X	Initial Calibration Verifications
	X	Daily Pulser Checks
X		Blank Results
X		Sample Specific Tracer Recoveries
	X	Laboratory Control Samples
	NA	Matrix Spike Results
	NA	Field Replicate Results
	X	Laboratory Duplicate Results
X		Radionuclide Quantitation and Minimal Detectable Activities
	X	Spectrometry Resolution

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the isotopic thorium and isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site (Lockport Sewer Locations).

Based upon the Th-230 method blank result the Th-230 result for Sewer Location #1 UW-0001 is qualified as estimated (J).

The Th-228, Th-230 and Th-232 results for Sewer Location # 2 UW-0002 are qualified as non-detected estimated (UJ). The Th-229 tracer recovery is 32%.

The Th-230 result for Sewer Location #1 UW-0001 is qualified as estimated (J). The reported result is greater than the MDC and less than the two sigma uncertainty.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 07/27/2011. The condition upon receipt form indicates that aqueous radionuclide samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Solid method blank results associated with preparation batches 1223198 and 1223199 are summarized below.

Radionuclide	Sample ID	Conc pCi/g	Total Uncertainty pCi/g	MDA pCi/g	Z-Factor
Th-228	F1H110000-198B	-0.0009	0.0018	0.0166	-0.9991
Th-230	F1H110000-198B	0.0221	0.0181	0.0099	2.4428
Th-232	F1H110000-198B	0.0073	0.0103	0.0099	1.4117
U-234	F1H110000-199B	0.0106	0.0150	0.0224	1.4117
U-235	F1H110000-199B	0.0053	0.0105	0.0142	0.9991
U-238	F1H110000-199B	0.0042	0.0084	0.0114	0.9991

MDA- Minimal Detectable Activity

No sludge results are qualified based upon the positive Th-230 method blank results. Th-230 sludge results are at concentrations more than 10 X the Th-230 method blank results.

Aqueous method blank results associated with preparation batches 1227018 and 1227019 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
Th-228	F1H150000-018B	0.0000	0.0075	0.0202	0.000
Th-230	F1H150000-018B	0.0225	0.0260	0.0203	1.7275
Th-232	F1H150000-018B	0.0000	0.0075	0.0202	0.000
U-234	F1H150000-019B	0.0133	0.0218	0.0344	1.2170
U-235	F1H150000-019B	-0.0024	0.0047	0.0428	-0.9991
U-238	F1H150000-019B	0.0000	0.0076	0.0205	0.0000

MDA- Minimal Detectable Activity

Using professional judgment the Th-230 result for Sewer Location # 1 UW-0001 is qualified as estimated (J). The reported positive Th-230 result is 0.026pCi/L +/- 0.030pci/L. Statistically this result is equal to the positive method blank result. Both the positive sample result and positive method blank results are less than the laboratory reporting limit 0.10 pCi/L.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer	Tracer Recovery
Sewer Location # 2 UW-0002	Th-229	32%

The Th-228, Th-230 and Th-232 results for Sewer Location # 2 UW-0002 are qualified as non-detected estimated (UJ).

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batches 1223198, 1227018, 122319 and 1227019 are summarized below. The laboratory did not analyze a LCSD. The laboratory did analyze a laboratory duplicate pair for each isotope in each matrix.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

All LCS recoveries are within the QAPP acceptance criteria and the laboratory derived acceptance criteria. U-235, Th-228 and Th-232 are not LCS spiked isotopes.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No MS/MSDs were analyzed. The laboratory analyzed a LCS and laboratory duplicate samples for each sample matrix.

No results are qualified due to the absence of MS/MSD results.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H020470.

No results are qualified based upon the absence of field duplicate results.

Laboratory Duplicates

The laboratory analyzed sludge sample Sewer Location #1 US-0001 (F1H020470-001) as the laboratory duplicate pair for analytical batches 1223198 and 1223199. Results are summarized below.

Analyte	Sewer Location #1 US-0001			Sewer Location #1 US-0001 DUP		
	Result pCi/g	TPU	MDA	Result pCi/g	TPU	MDA

TPU – Total Propagated Uncertainty

No aqueous results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
Sewer Location #1 UW-0001	Th-230	0.026	0.030	0.023

The Th-230 result for Sewer Location #1 UW-0001 is qualified as estimated (J).

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for Lockport Sewer Location #1 UW-0001 DUP (F1H020470-002 DUP) Batch 1227019

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 377
U-232 Tracer Background Counts: 1.25
U-232 Tracer net counts: 375.75
Count Time: 240 minutes
Detector Efficiency: 28.11%

U-232 Tracer recovered = (375.75)/(240)(0.0.2811) = 5.44 DPM
U-232 Tracer % Recovery = (5.44 DPM/7.155 DPM) * 100 = 77.8%. The laboratory reported 77.8%.

The Th-229 tracer recovery for Lockport Sewer Location #1 US-0001 (F1H020470-001) Batch 1223198

Th-229 Tracer concentration: 63.40 DPM/mL (DPM = disintegrations/minute)
Th-229 Tracer volume: 0.10 mL
Th-229 Tracer added: 6.340 DPM
Th-229 Tracer Gross Counts: 331
Th-229 Tracer Background Counts: 0.500
Th-229 Tracer net counts: 330.50
Count Time: 240 minutes
Detector Efficiency: 26.63%

Th-229 Tracer recovered = (330.50)/(240)(0.2663) = 5.171 DPM
Th-229 Tracer % Recovery = (5.171 DPM/6.34 DPM) * 100 = 81.6%. The laboratory reported 81.8%.

The U-234 concentration for Lockport Sewer Location #1 UW-0001 DUP (F1H020470-002 DUP) Batch 1227019

U-234 gross counts: 1265
U-234 background counts: 0.000
U-234 net counts: 1265
Count time: 240 minutes
Detector Efficiency: 28.11%
Tracer Recovery: 77.85%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (1265)/(2.22)(1.000)(240)(0.2811)(0.7785) = 10.85 pCi/L. The laboratory reported 10.87 pCi/L

The Th-230 concentration for Lockport Sewer Location #1 US-0001 (F1H020470-001) Batch 1223198

Th-230 gross counts: 104
Th-230 background counts: 0.250
Th-230 net counts: 103.75
Count time: 240 minutes
Detector Efficiency: 26.63%
Tracer Recovery: 81.85%
Sample mass: 2.001 grams
1 picocurie = 2.22 counts/minute

Th-230 Concentration: = (103.75)/(2.22)(2.000)(240)(0.2663)(0.8185) = 0.447 pCi/g. The laboratory reported 0.448 pCi/g

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Tot- Total Diss- Dissolved (field filtered)

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All isotopic uranium results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

The condition upon receipt form states that the COC did not list the bottles for the filtered fractions.

The laboratory used an incorrect sample ID on the report forms. The laboratory has used the sample ID A04DMW230001. The COC does not list this sample. The correct sample ID is A04AMW230001. This validation has used the ID that is listed on the COC, A04AMW230001 Tot and A04AMW230001 Diss.

Sample Preservation and Holding Times

Samples were collected on 08/04/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.
No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1228169 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H170000-169B	0.013	0.022	0.035	1.2171
U-235	F1H170000-169B	-0.0024	0.0047	0.043	-0.9991
U-238	F1H170000-169B	-0.0038	0.0053	0.040	-1.4117

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R).

All tracer recoveries were within the acceptance criteria. No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1228169 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100% and 99% respectively. U-235 is not a spiked isotope. All LCS recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090481.

No results are qualified based upon the absence of field replicate results.

Laboratory Duplicates

Guterl steel sample A04AMW220001 Tot (F1H090496-02) associated with preparation batch 1228169 was analyzed as the laboratory duplicate sample. Results are summarized below.

Analyte	A04AMW220001 Tot			A04AMW220001 Tot DUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	24.34	2.33	0.034	24.30	2.30	0.062
U-235	1.03	0.27	0.043	1.27	0.293	0.040
U-238	24.83	2.37	0.034	23.20	2.21	0.032

TPU – Total Propagated Uncertainty

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A04DMW240001 Tot (F1H090481-001)

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer net counts: 320
Count Time: 240 minutes
Detector Efficiency: 27.75%

U-232 Tracer recovered = (320)/(240)(0.2775) = 4.804 DPM
U-232 Tracer % Recovery = (4.804 DPM/7.155 DPM) * 100 = 67.14%. The laboratory reported 67.145%.

The U-238 concentration for A04DMW240001 Tot (F1H090481-001)

U-238 net counts: 1254
Count time: 240 minutes

Detector Efficiency: 27.75%
Tracer Recovery: 67.15%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute
U-238 Concentration: = (1254)/(2.22)(1.000)(240)(0.2775)(0.6715) = 12.6 pCi/L. The laboratory reported 12.6 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Tot- Total Diss- Dissolved (field filtered)

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	No	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration

	NA	Field Duplicate Precision
X		ICP-MS Serial Dilutions
	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The ICP-MS serial dilution % difference is 18.4%. Uranium results for A04DMW240001 Tot, A04AMW230001 Tot, A04DMW713D0001 Tot, A04BMW190001Tot, A04DMW240001 Diss, A04AMW230001 Diss, A04DMW713D0001 Diss and A04BMW190001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total results are at concentrations greater than the dissolved sample results.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The condition upon receipt form states that the COC did not list the bottles for the filtered fractions.

The laboratory used an incorrect sample ID on the report forms. The laboratory has used the sample ID A04DMW230001. The COC does not list this sample. The correct sample ID is A04AMW230001. This validation has used the ID that is listed on the COC, A04AMW230001 Tot and A04AMW230001 Diss.

Sample Preservation and Holding Times

Samples were collected on 08/04/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time ICP-MS analysis is 180 days. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery is 94.4%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04AMW220001 Tot was the MS/MSD pair associated with preparation batch 1222061. These sample results were reported in laboratory data package F1H090496. The MS/MSD recoveries are 105.2% and 108.2% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04AMW220001 Tot, reported in laboratory data package F1H090496, was the MS/MSD pair associated with preparation batch 1222061. The laboratory duplicate RPD is 2.6%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090481.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Serial dilution sample A04AMW220001 Tot is associated with preparation batch 1222061. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	73.6	87.2	18.4	J

The uranium results for A04DMW240001 Tot, A04AMW230001 Tot, A04DMW713D0001 Tot, A04BMW190001Tot, A04DMW240001 Diss, A04AMW230001 Diss, A04DMW713D0001 Diss and A04BMW190001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution. The laboratory reported results between the method detection limit (MDL) and reporting limit (RL) as estimated (J).

All field sample results are at concentrations greater than the RL.

All total and dissolve fraction results agree within 20%.

Calculations

Sample A04AMW22001, reported in laboratory data package F1H090496, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 73.6 ug/L
MS uranium concentration: 1130 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1130 ug/L – 73.6 ug/L)/ 1000 ug/L)) * 100 = 105.7%. The laboratory reported 105.2%.

Serial Dilution:
Sample uranium concentration: 73.6 ug/L
Serial dilution concentration of the 5X dilution: 87.2 ug/L
Serial Dilution % Difference = Absolute value ((73.6 ug/L-87.2 ug/L))/ (73.6 ug/L))* 100 = 18.5%. The laboratory reported 18.4%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All isotopic uranium results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/05/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1228169 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H170000-169B	0.013	0.022	0.035	1.2171
U-235	F1H170000-169B	-0.0024	0.0047	0.043	-0.9991
U-238	F1H170000-169B	-0.0038	0.0053	0.040	-1.4117

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 1220942 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H170000-042B	-0.006	0.007	0.047	0.047
U-235	F1H170000-042B	-0.002	0.005	0.046	0.046
U-238	F1H170000-042B	0.020	0.028	0.043	0.043

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R).

All tracer recoveries were within the acceptance criteria. No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1228169 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100% and 99% respectively. U-235 is not a spiked isotope. All LCS recoveries are within the QAPP acceptance criteria; 73-131%.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1229042 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 99.7% and 103% respectively. U-235 is not a spiked isotope. All LCS recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090496.

No results are qualified based upon the absence of field replicate results.

Laboratory Duplicates

Guterl steel sample A04AMW220001Tot associated with preparation batch 1228169 was analyzed as the laboratory duplicate sample. Results are summarized below.

Analyte	A04AMW220001 Tot			A04AMW220001 Tot DUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	24.34	2.33	0.034	24.30	2.30	0.062
U-235	1.03	0.27	0.043	1.27	0.293	0.040
U-238	24.83	2.37	0.034	23.20	2.21	0.032

TPU – Total Propagated Uncertainty

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Guterl steel sample A04AMW220001 Dissolved associated with preparation batch 1220942 was analyzed as the laboratory duplicate sample. Results are summarized below.

Analyte	A04AMW220001 Dissolved			A04AMW220001 Dissolved DUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	21.58	2.06	0.088	23.09	2.18	0.058
U-235	1.05	0.26	0.037	1.22	0.28	0.062
U-238	21.20	2.03	0.030	22.69	2.15	0.069

TPU – Total Propagated Uncertainty

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered)

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration

	X	Matrix and Matrix Spike Duplicate Recoveries
	X	Laboratory Duplicate Precision
	X	Laboratory Control Samples (Blank Spike)
	NA	Field Duplicate Precision
X		ICP-MS Serial Dilutions
	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The ICP-MS serial dilution % differences are 18.4% and 35.5%. Uranium results for A04AMW603D0001 Tot, A04AMW220001 Tot, A04BMW180001 Tot, A04AMW603D0001 Diss, A04AMW220001 Diss and A04BMW180001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total results are at concentrations greater than the dissolved sample results.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/05/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery is 94.4%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04AMW220001 Tot was the MS/MSD pair associated with preparation batch 1222061. The MS/MSD recoveries are 105.2% and 108.2% respectively.

Sample A04AMW220001 Diss was the MS/MSD pair associated with preparation batch 1222062. The MS/MSD recoveries are 106.1% and 106.5% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04AMW220001 Tot was the MS/MSD pair associated with preparation batch 1222061. The RPD is 2.6%

Sample A04AMW220001 Diss was the MS/MSD pair associated with preparation batch 1222062. The RPD is 0.31%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090496.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%. Two LCS samples were reported; one for preparation batch 1222061 and one for preparation batch 1222062.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Two serial dilution samples were analyzed. Serial dilution sample A04AMW220001 Tot is associated with preparation batch 1222061. Serial dilution sample A04AMW220001 Diss is associated with preparation batch 1222062. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	73.6	87.2	18.4	J
Uranium	65.1	88.3	35.6	J

Uranium results for A04AMW603D0001 Tot, A04AMW220001 Tot, A04BMW180001 Tot, A04AMW603D0001 Diss, A04AMW220001 Diss and A04BMW180001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution. The laboratory reported results between the method detection limit (MDL) and reporting limit (RL) as estimated (J).

All field sample results are at concentrations greater than the RL.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The U-232 tracer recovery for sample A02MW080001 Total is 37.4%. The U-234and U-238 results for A02MW080001 Total are qualified as estimated (J) and the U-235 result for A02MW08001 Total is qualified as non-detected estimated (UJ).

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/08/2011. According to the COC, samples were received on ice at 2^{o} C. The temperature requirement is 4^{o} C$\pm$ 2^{o} C. No results are qualified based upon this deviation.

The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H170000-042B	-0.006	0.007	0.047	0.047
U-235	F1H170000-042B	-0.002	0.005	0.046	0.046
U-238	F1H170000-042B	0.020	0.028	0.043	0.043

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). The U-232 tracer recovery for sample A02MW080001 Total is 37.4%. The U-234 and U-238 results for A02MW080001 Total are qualified as estimated (J). The U-235 result for A02MW080001 Total is qualified as non-detected estimated (UJ).

All other tracer recoveries were within the laboratory derived acceptance criteria. No other results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries were 99.7% and 103% respectively. U-235 is not a spiked isotope.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090504.

No results are qualified based upon the absence of field replicate results.

Laboratory Duplicates

Guterl steel sample A04AMW220001 Dissolved (F1H090496-005) reported in laboratory data package F1H090496 was analyzed as the laboratory duplicate sample. Results are summarized below.

Analyte	A04AMW220001 Dissolved			A04AMW220001 Dissolved DUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	21.58	2.06	0.088	23.09	2.18	0.058
U-235	1.05	0.26	0.037	1.22	0.28	0.062
U-238	21.20	2.03	0.030	22.69	2.15	0.069

TPU – Total Propagated Uncertainty

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ) based upon tracer recoveries. No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered)

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 6020A (acid digestion) Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration

	X	Laboratory Control Samples (Blank Spike)
	NA	Field Duplicate Precision
X		ICP-MS Serial Dilutions
	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The ICP-MS serial dilution % difference is 35.5%. Uranium results for A02MW110001 Total, A02MW090001 Total, A02MW080001 Total, SEEP 01 Total, SEEP 02 Total, A02MW110001 Dissolved, A02MW090001 Dissolved, A02MW080001 Dissolved, SEEP 01 Dissolved and SEEP 02 Dissolved are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total results are detected at concentrations greater than the dissolved sample results.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/08/2011. According to the COC, samples were received on ice at 2^{o} C. The temperature requirement is 4^{o} C $\pm$ 2^{o} C. No results are qualified based upon sample receipt temperatures.

The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery is 94.4%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	LOQ	Blank Conc
None					

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

The MS/MSD sample that was analyzed for total and dissolved uranium was reported in laboratory data package F1H090496. The Shaw sample ID is A04AMW220001 Dissolved. The MS/MSD recoveries were 106.1% and 106.5% respectively and the duplicate relative percent difference is 0.3%. The QAPP acceptance criteria are recoveries between 75-125% and RPDs $\leq$ 30%.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance %RPD for laboratory duplicate samples is $\leq$ 30%.

The MS/MSD sample that was analyzed for total and dissolved uranium was reported in laboratory data package F1H090496. The Shaw sample ID is A04AMW220001 Dissolved. The MS/MSD duplicate relative percent difference is 0.3%. The QAPP acceptance criterion are RPDs $\leq$ 30%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H090504.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP and ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04AMW220001 Dissolved reported in laboratory data package F1H090496 was analyzed as the ICP-MS serial dilution sample ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	65.1	88.3	35.6	J

Uranium results for A02MW110001 Total, A02MW090001 Total, A02MW080001 Total, SEEP 01 Total, SEEP 02 Total, A02MW110001 Dissolved, A02MW090001 Dissolved, A02MW080001 Dissolved, SEEP 01 Dissolved and SEEP 02 Dissolved are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased low.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution. The laboratory reported results between the method detection limit (MDL) and reporting limit (RL) as estimated (J).

All field sample results are at concentrations greater than the RL.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All isotopic uranium results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/09/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1220942 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H170000-042B	-0.006	0.007	0.047	0.047
U-235	F1H170000-042B	-0.002	0.005	0.046	0.046
U-238	F1H170000-042B	0.020	0.028	0.043	0.043

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R).

All tracer recoveries were within the acceptance criteria. No other results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1229042 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 99.7% and 103% respectively. U-235 is not a spiked isotope. All LCS recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H100419.

No results are qualified based upon the absence of field replicate results.

Laboratory Duplicates

Guterl steel sample A04AMW220001 Dissolved associated with preparation batch 1220942 was analyzed as the laboratory duplicate sample. Results are summarized below.

Analyte	A04AMW220001 Dissolved			A04AMW220001 Dissolved DUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	21.58	2.06	0.088	23.09	2.18	0.058
U-235	1.05	0.26	0.037	1.22	0.28	0.062
U-238	21.20	2.03	0.030	22.69	2.15	0.069

TPU – Total Propagated Uncertainty

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The laboratory has reported positive results between the method detection limit (MDL) and RL. The uranium results for MW705D0001 and MW705DD0001Diss are qualified as estimated (J). The reported results are between the MDL and RL.

All other field sample results are detected at concentrations greater than the RL. All total results are at concentrations greater than the dissolved sample results.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/09/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recoveries were 97.4% and 93.7%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample MW705D0001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1223087. The MS/MSD recoveries are 112.4% and 113% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample MW705D0001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1223087. The MS/MSD RPD is 0.5%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H100419.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample MW705D0001Tot was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium results for MW705D0001Tot and MW705DD0001Diss are qualified as estimated (J). The reported results are between the MDL and RL.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL)

Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The U-234, U-235 and U-238 results for A04BMW605D0001 Diss, A04BMW9000 Diss and A04BMW9000 Tot are qualified as estimated (J). The U-232 tracer recoveries for these samples are less than 40%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/10/2011. The condition upon receipt form indicates that aqueous metal samples were not properly preserved. The laboratory noted that the total and dissolved fractions for samples A04DMW709DD0001 and A04MW604D0001 were received at pH 7. The laboratory acidified the samples to a pH < 2. Samples sat for more than 24 hours at pH 2 before preparation.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1228169 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H190000-145B	0.005	0.015	0.032	0.727
U-235	F1H190000-145B	0.000	0.009	0.024	0.000
U-238	F1H190000-145B	0.005	0.015	0.032	0.727

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries

less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
A04BMW605D0001 Diss	37%
A04BMW9000 Diss	35%
A04BMW9000 Tot	38%

The U-234, U-235 and U-238 results for A04BMW605D0001 Diss, A04BMW9000 Diss and A04BMW9000 Tot are qualified as estimated (J).

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1231145 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 109% and 103% respectively. The U-234 and U-238 LCSD recoveries are 95.2% and 101% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Four field duplicate pairs are reported in laboratory data package F1H110460; A04BMW605D0001 Diss/A04BMW9000 Diss, A04BMW9001 Diss/A04DMW704DD0001 Diss, A04BMW605D0001 Tot/A04BMW9000 Tot and A04BMW704DD0001 Tot/A04BMW9001 Tot. The field duplicate RPDs are less than 50%.

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample. Results are summarized below.

Analyte	F1H190000-145C LCS			F1H190000-145L LCS		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.55	0.47	0.02	3.11	0.40	0.02
U-235	0.12	0.076	0.052	0.20	0.088	0.025
U-238	3.48	0.46	0.06	3.41	0.43	0.02

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A04DMW704DD0001 Diss (F1H110460-007)

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer net counts: 370.25
Count Time: 240 minutes
Detector Efficiency: 29.30%

U-232 Tracer recovered = (370.25)/(240)(0.2930) = 5.265 DPM
U-232 Tracer % Recovery = (5.265 DPM/7.155 DPM) * 100 = 73.58%. The laboratory reported 73.61%.

The U-234 concentration for A04DMW704DD0001 Diss (F1H110460-007)

U-234 gross counts: 1237
U-234 background counts: 1.500
U-234 net counts: 1235.5
Count time: 240 minutes
Detector Efficiency: 29.30%
Tracer Recovery: 73.61%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (1235.5)/(2.22)(1.000)(240)(0.2930)(0.7361) = 10.75 pCi/L. The laboratory reported 10.77 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved

uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

All results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/10/2011. The condition upon receipt form indicates that aqueous metal samples were not properly preserved. The laboratory noted that the total and dissolved fractions for samples A04DMW709DD0001 and A04MW604D0001 were received at pH 7. The laboratory acidified the samples to a pH < 2. Samples sat for more than 24 hours at pH 2 before preparation.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was 96.8%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04MW604D0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1224017. The MS/MSD recoveries are 102.5% and 102.3% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04MW604D0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1224017. The MS/MSD RPD is 0.2%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Four field duplicate pairs are reported in laboratory data package F1H110460; A04BMW605D0001 Diss/A04BMW9000 Diss, A04BMW9001 Diss/A04DMW704DD0001 Diss, A04BMW605D0001 Tot/A04BMW9000 Tot and A04BMW704DD0001Tot/A04BMW9001Tot. The field duplicate RPDs are 0.1%, 2.2%, 1.9% and 5.0% respectively.

No results are qualified based upon the field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04MW604D0001 Diss was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

Calculations

Sample A04MW604D0001 Diss, reported in laboratory data package F1H110460, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 101 ug/L
MS uranium concentration: 1130 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1130 ug/L – 101 ug/L)/ 1000 ug/L)) * 100 = 102.9%. The laboratory reported 102.5%.

Serial Dilution:
Sample uranium concentration: 101 ug/L
Serial dilution concentration of the 5X dilution: 101 ug/L
Serial Dilution % Difference = Absolute value ((101 ug/L-101 ug/L))/ (101 ug/L))* 100 = 0.1%. The laboratory reported 0.12%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	Initial Calibrations
	X	Initial Calibration Verifications
	X	Daily Pulser Checks

	NA	Matrix Spike Results
	X	Field Replicate Results
	X	Laboratory Duplicate Results
	X	Radionuclide Quantitation and Minimal Detectable Activities
	X	Spectrometry Resolution

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All isotopic uranium results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/11/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1231165 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H190000-165B	0.013	0.021	0.034	1.217
U-235	F1H190000-165B	0.009	0.018	0.025	0.999
U-238	F1H190000-165B	-0.004	0.005	0.039	-1.412

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1231165 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 91% and 98% respectively. The U-234 and U-238 LCSD recoveries are 100% and 106% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Two field duplicate pairs are reported in laboratory data package F1H120447; A04DMW708DD0001 Tot/A04DMW9002 Tot and A04DMW708DD0001 Diss/A04DMW9002 Diss. The field duplicate RPDs are less than 50%.

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The U-232 tracer recoveries for these samples are less than 40%.

Analyte	F1H190000-165C			F1H190000-165L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	2.97	0.40	0.048	3.27	0.44	0.046
U-235	0.14	0.077	0.027	0.11	0.069	0.029
U-238	3.32	0.43	0.037	3.60	0.46	0.023

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A04MW602D0001 Diss (F1H120447-001)

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 245
U-232 Tracer Background Counts: 0.00
U-232 Tracer net counts: 245
Count Time: 240 minutes
Detector Efficiency: 27.40%
U-232 Tracer recovered = (245)/(240)(0.2740) = 3.726 DPM
U-232 Tracer % Recovery = (3.726 DPM/7.155 DPM) * 100 = 52.07%. The laboratory reported 52.09%.

The U-238 concentration for A04MW602D0001 Diss (F1H120447-001)
U-238 gross counts: 2605
U-238 background counts: 0.25

U-238 net counts: 2604.75
Count time: 240 minutes
Detector Efficiency: 27.40%
Tracer Recovery: 52.09%
Sample volume: 0.930 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (2604.75)/(2.22)(0.930)(240)(0.2740)(0.5209) = 36.83 pCi/L. The laboratory reported 36.82 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data*

Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

All results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/11/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was 96.8%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the MS/MSD pair associated with preparation batch 1227138. The MS/MSD recoveries are 106.9% and 108.6% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the MS/MSD pair associated with preparation batch 1227138. The MS/MSD RPD is 1.42%

No results are qualified based upon laboratory duplicate precision.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

Two field duplicate pairs are reported in laboratory data package F1H120447; A04DMW708DD0001 Tot/A04DMW9002 Tot and A04DMW708DD0001 Diss/A04DMW9002 Diss. The field duplicate RPDs are 0.4% and 0.9% respectively.

No results are qualified based upon the field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

Calculations

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 112 ug/L
MS uranium concentration: 1180 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1180 ug/L – 112 ug/L)/ 1000 ug/L)) * 100 = 106.8%. The laboratory reported 106.9%.

Serial Dilution:
Sample uranium concentration: 112 ug/L
Serial dilution concentration of the 5X dilution: 21.6 ug/L * 5 = 108 ug/L
Serial Dilution % Difference = Absolute value ((112 ug/L-108 ug/L))/ (112 ug/L))* 100 = 3.5%. The laboratory reported 3.4%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	Initial Calibrations
	X	Initial Calibration Verifications

	X	Radionuclide Quantitation and Minimal Detectable Activities
	X	Spectrometry Resolution

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The U-234, U-235 and U-238 results for A04BMW250001 Tot and A04BMW250001 Diss are qualified as estimated (J). The U-232 tracer recoveries for these samples are less than 40%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/12/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1231165 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H190000-165B	0.013	0.021	0.034	1.217
U-235	F1H190000-165B	0.009	0.018	0.025	0.999
U-238	F1H190000-165B	-0.004	0.005	0.039	-1.412

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
A04BMW250001 Tot	38.8%
A04BMW250001 Diss	36.6%

The U-234, U-235 and U-238 results for A04BMW250001 Tot and A04BMW250001 Diss are qualified as estimated (J).

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1231165 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 91% and 98% respectively. The U-234 and U-238 LCSD recoveries are 100% and 106% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Two field duplicate pairs are reported in laboratory data package F1H130407; A04BMW250001 Tot/A04BMW9003 Tot and A04BMW250001 Diss/A04BMW9003 Diss. The field duplicate RPDs are less than 50%.

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The U-232 tracer recoveries for these samples are less than 40%.

Analyte	F1H190000-165C			F1H190000-165L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	2.97	0.40	0.048	3.27	0.44	0.046
U-235	0.14	0.077	0.027	0.11	0.069	0.029
U-238	3.32	0.43	0.037	3.60	0.46	0.023

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A02MW060001 Diss (F1H130407-007)

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 329
U-232 Tracer Background Counts: 0.25
U-232 Tracer net counts: 328.75
Count Time: 240 minutes
Detector Efficiency: 27.08%
U-232 Tracer recovered = (328.75)/(240)(0.2708) = 5.058 DPM
U-232 Tracer % Recovery = (5.058 DPM/7.155 DPM) * 100 = 70.70%. The laboratory reported 70.70%.

The U-238 concentration for A02MW060001 Diss (F1H130407-007)
U-238 gross counts: 106
U-238 background counts: 0.25

U-238 net counts: 105.75
Count time: 240 minutes
Detector Efficiency: 27.08%
Tracer Recovery: 70.71%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (105.75)/(2.22)(1.000)(240)(0.2708)(0.7071) = 1.036 pCi/L. The laboratory reported 1.036 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data*

Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

All results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/12/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was 96.8%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the MS/MSD pair associated with preparation batch 1227138 for data package F1H130407. The MS/MSD recoveries are 106.9% and 108.6% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the MS/MSD pair associated with preparation batch 1227138 for data package F1H130407. The MS/MSD RPD is 1.42%

No results are qualified based upon laboratory duplicate precision.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

Two field duplicate pairs are reported in laboratory data package F1H130407; A04BMW250001 Tot/A04BMW9003 Tot and A04BMW250001 Diss/A04BMW9003 Diss. The field duplicate RPDs are 0.6% and 1.7% respectively.

No results are qualified based upon the field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the ICP-MS serial dilution sample for data package F1H130407. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

Calculations

Sample A04MW602D0001 Diss, reported in laboratory data package F1H120447, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 112 ug/L
MS uranium concentration: 1180 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1180 ug/L – 112 ug/L)/ 1000 ug/L)) * 100 = 106.8%. The laboratory reported 106.9%.

Serial Dilution:
Sample uranium concentration: 112 ug/L
Serial dilution concentration of the 5X dilution: 21.6 ug/L * 5 = 108 ug/L
Serial Dilution % Difference = Absolute value ((112 ug/L-108 ug/L))/ (112 ug/L))*100 = 3.5%. The laboratory reported 3.4%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

Using professional judgment the U-234 results for A04DMW710D0001 Diss and A04DMW710D0001 Tot are qualified as estimated (J). These results are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L
U-234	A04DMW710D0001 Diss	24.0	2.33	0.065
U-234	A04DMW710D0001 Tot	19.1	1.87	0.033

MDA- Minimal Detectable Activity

The result for the dissolved fraction of sample A04DMW710D0001 is significantly greater than the total fraction.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample cooler. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/15/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1234168 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H220000-168B	0.019	0.027	0.040	1.4117
U-235	F1H220000-168B	-0.002	0.005	0.043	-0.9991
U-238	F1H220000-168B	-0.002	0.004	0.035	-0.9991

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1234168 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 95% and 100% respectively. The U-234 and U-238 LCSD recoveries are 95.3% and 95.3% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H160430. No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample. Results are summarized below.

Analyte	F1H220000-168C			F1H220000-168L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.09	0.40	0.046	3.11	0.41	0.054
U-235	0.13	0.071	0.026	0.16	0.083	0.052
U-238	3.39	0.43	0.041	3.23	0.42	0.042

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A04BMW706D0001 Tot (F1H160430-003)

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 280.0
U-232 Tracer Background Counts: 1.25
U-232 Tracer net counts: 278.75
Count Time: 240 minutes
Detector Efficiency: 28.11%

U-232 Tracer recovered = (278.75)/(240)(0.2811) = 4.13 DPM

U-232 Tracer % Recovery = (4.13 DPM/7.155 DPM) * 100 = 57.75%. The laboratory reported 57.76%.

The U-238 concentration for A04BMW706D0001 Tot (F1H160430-003)

U-238 gross counts: 42
U-238 background counts: 0.500
U-238 net counts: 41.5
Count time: 240 minutes
Detector Efficiency: 28.11%
Tracer Recovery: 57.76%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (41.5)/(2.22)(1.000)(240)(0.2811)(0.5776) = 0.48 pCi/L. The laboratory reported 0.48 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters

	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

All results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/15/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was is 99.7%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04BMW706D0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1229103. The MS/MSD recoveries are 111.5% and 111.7% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04BMW706D0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1229103. The MS/MSD RPD is 0.1%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H160430.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04BMW706D0001 Diss was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below. The uranium result for A04BMW706D0001 Diss is 1.7 ug/L. The uranium sample concentration is less than 2X the reporting limit (RL). The uranium concentration is sample A04BMW706D0001 Diss is too low to evaluate the serial dilution results.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%.

Calculations

Sample A04BMW706D0001 Diss, reported in laboratory data package F1H160430, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 1.7 ug/L
MS uranium concentration: 1120 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1120 ug/L – 1.7 ug/L)/ 1000 ug/L)) * 100 = 111.8%. The laboratory reported 111.5%.

Serial Dilution:
Sample uranium concentration: 1.7 ug/L
Serial dilution concentration of the 5X dilution: 1.8 ug/L
The serial dilution% difference is not calculated because the sample concentration is not greater than 50X the IDL.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate LDUP- Laboratory Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by*

EIChroM ® Separation Resins (STL-RC-240). The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory narrative noted that samples A03MW14D0001 Diss, A04CMW711DD0001 Diss, and A03MW17D0001 Tot had U-232 tracer recoveries below 30%. The laboratory re-extracted and re-analyzed these samples. The U-232 tracer recoveries met the laboratory acceptance criteria for the re-analyses. Due to limited sample volume 250 mLs of sample were extracted for A03MW14D0001 Diss, A04CMW711DD0001 Diss, and A03MW17D0001 Tot. The minimum detectable concentrations (MDCs) were elevated because of the smaller sample volumes.

The U-234, U-235 and U-238 results for A03MW606D0001 Diss, A03MW606DR0001 Diss and A03MW606D0001 Tot are qualified as estimated (J). The U-234 and U-238 results for A04CMW711DD0001 Tot are qualified as estimated (J) and the U-235 result for A04CMW711DD0001 Tot is qualified as non-detected estimated (UJ). The U-232 tracer recoveries are below 40%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/15/2011 and 08/16/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1234168 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H220000-168B	0.019	0.027	0.040	1.4117
U-235	F1H220000-168B	-0.002	0.005	0.043	-0.9991
U-238	F1H220000-168B	-0.002	0.004	0.035	-0.9991

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 1238036 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H260000-036B	-0.002	0.017	0.051	-0.218
U-235	F1H260000-036B	0.007	0.019	0.045	0.727
U-238	F1H260000-036B	-0.004	0.005	0.040	-1.412

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
A03MW606D0001 Diss	38.5%
A03MW606DR0001 Diss	36.6%
A03MW606D0001 Tot	36.6%
A04CMW711DD0001 Tot	30.8%

The U-234, U-235 and U-238 results for A03MW606D0001 Diss, A03MW606DR0001 Diss and A03MW606D0001 Tot are qualified as estimated (J). The U-234 and U-238 results for A04CMW711DD0001 Tot are qualified as estimated (J) and the U-235 result for A04CMW711DD0001 Tot is qualified as non-detected estimated (UJ).

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1234168 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 95% and 100% respectively. The U-234 and U-238 LCSD recoveries are 95.3% and 95.3% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

The laboratory reported LCS results and laboratory duplicate results for preparation batch 1238036. LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1238036 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 97.5% and 110% respectively. U-235 is not a spiked isotope. All LCS recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS/LCSD recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H170425.

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample for batch 1234168. Results are summarized below.

Analyte	F1H220000-168C			F1H220000-168L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.09	0.40	0.046	3.11	0.41	0.054
U-235	0.13	0.071	0.026	0.16	0.083	0.052
U-238	3.39	0.43	0.041	3.23	0.42	0.042

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Sample A03MW14D0001 Diss was analyzed as the laboratory duplicate sample for batch 1238036. Results are summarized below.

Analyte	A03MW14D0001 Diss			A03MW14D0001 Diss LDUP		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	2.49	0.82	0.39	2.35	0.64	0.25
U-235	-0.038	0.054	0.40	0.049	0.097	0.13
U-238	2.09	0.74	0.32	1.96	0.58	0.23

All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Samples A03MW14D0001 Diss, A04CMW711DD0001 Diss, and A03MW17D0001 Tot were re-extracted because of low U-232 tracer recoveries. Due to limited sample volumes for the re-extractions only 250 mLs of sample were extracted for A03MW14D0001 Diss, A04CMW711DD0001 Diss and A03MW17D0001 Tot. The minimum detectable concentrations (MDCs) were elevated because of the smaller sample volumes.

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A03MW14D0001Tot (F1H170425-008) Batch 1234168

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 192
U-232 Tracer Background Counts: 0.250
U-232 Tracer net counts: 191.75
Count Time: 240 minutes
Detector Efficiency: 26.58%

U-232 Tracer recovered = (191.75)/(240)(0.2658) = 3.006 DPM
U-232 Tracer % Recovery = (3.006 DPM/7.155 DPM) * 100 = 42.01%. The laboratory reported 42.03%.

The U-238 concentration for A03MW14D0001Tot (F1H170425-008) Batch 1234168

U-238 gross counts: 124
U-238 background counts: 0.000
U-238 net counts: 124
Count time: 240 minutes
Detector Efficiency: 26.58%
Tracer Recovery: 42.03%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (124)/(2.22)(1.000)(240)(0.2658)(0.4203) = 2.08 pCi/L. The laboratory reported 2.08 pCi/L

The U-232 tracer recovery for A03MW14D0001 Diss (F1H170425-002) Batch 1238036

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 212
U-232 Tracer Background Counts: 0.000
U-232 Tracer net counts: 212.00
Count Time: 240 minutes
Detector Efficiency: 26.58%

U-232 Tracer recovered = (212.00)/(240)(0.2658) = 3.323 DPM
U-232 Tracer % Recovery = (3.323 DPM/7.155 DPM) * 100 = 46.44%. The laboratory reported 46.47%.

The U-238 concentration for A03MW14D0001 Diss (F1H170425-002) Batch 1238036

U-238 gross counts: 35
U-238 background counts: 0.500
U-238 net counts: 34.50
Count time: 240 minutes
Detector Efficiency: 26.58%
Tracer Recovery: 46.47%
Sample volume: 0.250 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (34.50)/(2.22)(0.250)(240)(0.2658)(0.4647) = 2.09 pCi/L. The laboratory reported 2.09 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data*

Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%, except for A04CMW711DD0001 Diss and A04CMW711DD0001 Tot. The uranium results are 2.9 ug/L and 1.7 ug/L respectively. Both results are greater than 5X the MDL (0.23 ug/L). Using professional judgment the uranium results for A04CMW711DD0001 Diss and A04CMW711DD0001 Tot are qualified as estimated (J).

All other results are accepted without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/15/2011 and 08/16/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was is 99.7%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04BMW706D0001 Diss, reported in laboratory data package F1H160430, was analyzed as the MS/MSD pair associated with preparation batch 1229103. The MS/MSD recoveries are 111.5% and 111.7% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04BMW706D0001 Diss, reported in laboratory data package F1H160430, was analyzed as the MS/MSD pair associated with preparation batch 1229103. The MS/MSD RPD is 0.1%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H170425.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04BMW706D0001 Diss, reported in laboratory data package F1H160430, was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below. The uranium result for A04BMW706D0001 Diss is 1.7ug/L. The uranium sample concentration is less than 2X the reporting limit (RL). The uranium concentration is sample A04BMW706D0001 Diss is too low to evaluate the serial dilution results.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All field sample results are detected at concentrations greater than the RL. All total and dissolved results agree within 20%, except for A04CMW711DD0001 Diss and A04CMW711DD0001 Tot. The uranium results are 2.9 ug/L and 1.7 ug/L respectively. Both results are greater than 5X the MDL. Using professional judgment the uranium results for A04CMW711DD0001 Diss and A04CMW711DD0001 Tot are qualified as estimated (J).

Calculations

Sample A04BMW706D0001 Diss, reported in laboratory data package F1H160430, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 1.7 ug/L
MS uranium concentration: 1120 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1120 ug/L – 1.7 ug/L)/ 1000 ug/L)) * 100 = 111.8%. The laboratory reported 111.5%.

Serial Dilution:
Sample uranium concentration: 1.7 ug/L
Serial dilution concentration of the 5X dilution: 1.8 ug/L
The serial dilution% difference is not calculated because the sample concentration is not greater than 50X the IDL.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents

	NA	Matrix Spike Results
	NA	Field Replicate Results
	X	Laboratory Duplicate Results
	X	Radionuclide Quantitation and Minimal Detectable Activities
	X	Spectrometry Resolution

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A04AM2100001 Diss rather than the client ID on the chain of custody, A04AMW210001 Diss. This validation uses the client ID as reported on the chain of custody, A04AMW210001 Diss.

All results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.
The laboratory used an incorrect sample identity. The laboratory used the client sample ID A04AM2100001 Diss rather than the client ID on the chain of custody, A04AMW210001 Diss. This validation uses the client ID as reported on the chain of custody, A04AMW210001 Diss.

Sample Preservation and Holding Times

Samples were collected on 08/18/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1235027 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H230000-027B	0.025	0.034	0.053	1.452
U-235	F1H230000-027B	-0.003	0.005	0.047	-0.999
U-238	F1H230000-027B	0.006	0.017	0.037	0.727

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1235027 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 87.6% and 98.0% respectively. The U-234 and U-238 LCSD recoveries are 94.7% and 100% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS/LCSD recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H190431. No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample for batch 1235027. Results are summarized below.

Analyte	F1H230000-027C			F1H230000-027L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	2.86	0.388	0.037	3.09	0.407	0.046
U-235	0.262	0.105	0.027	0.216	0.094	0.027
U-238	3.32	0.431	0.048	3.39	0.434	0.036

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. All difference factors are below the control limits. No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved. The spectra for LCS/LCSDs F1H230000-027C and F1H230000-027L were resolved manually. The full width half maximums for F1H230000-027C were almost twice those reported for the field samples. The LCS/LCSD recoveries were within the acceptance criteria and the U-232 tracer recoveries were 84.9% and 87.4% respectively.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04DMW712DD0001 Diss (F1H190431-003) Batch 1235027

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 274
U-232 Tracer Background Counts: 1.500

U-232 Tracer net counts: 272.50
Count Time: 240 minutes
Detector Efficiency: 27.67%

U-232 Tracer recovered = (272.50)/(240)(0.2767) = 4.103 DPM
U-232 Tracer % Recovery = (4.103 DPM/7.155 DPM) * 100 = 57.35%. The laboratory reported 57.37%.

The U-234 concentration for A04DMW712DD0001 Diss (F1H190431-003) Batch 1235027

U-234 gross counts: 1184
U-234 background counts: 1.250
U-234 net counts: 1182.75
Count time: 240 minutes
Detector Efficiency: 27.67%
Tracer Recovery: 57.37%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (1182.75)/(2.22)(1.000)(240)(0.2767)(0.5737) = 13.98 pCi/L. The laboratory reported 14.0 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data*

Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A04AM2100001 Diss rather than the client ID on the chain of custody, A04AMW210001 Diss. This validation uses the client ID as reported on the chain of custody, A04AMW210001 Diss.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A04DFB710DD0001 Diss is qualified as estimated (J). The reported result is between the method detection limit (MDL) and RL.

All other results are accepted without qualification. All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A04AM2100001 Diss rather than the client ID on the chain of custody, A04AMW210001 Diss. This validation uses the client ID as reported on the chain of custody, A04AMW210001 Diss.

Sample Preservation and Holding Times

Samples were collected on 08/18/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was is 98.7%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW710DD0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1234135. The MS/MSD recoveries are 105% and 102% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A04DMW710DD0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1234135. The MS/MSD RPD is 2.9%

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H190431.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW710DD0001 Diss was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A04DFB710DD0001 Diss is qualified as estimated (J). The reported result is between the method detection limit (MDL) and RL.

All other results are accepted without qualification. All total and dissolved results agree within 20%.

Calculations

Sample A04DMW710D0001 Diss, reported in laboratory data package F1H190431, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 67.0 ug/L
MS uranium concentration: 1120 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1120 ug/L – 67.0 ug/L)/ 1000 ug/L)) * 100 = 105.3%. The laboratory reported 105.0%.

Serial Dilution:
Sample uranium concentration: 67.0 ug/L
Serial dilution concentration of the 5X dilution: 62.7 ug/L
ICP-MS Serial Dilution Percent Difference = ((67.0-62.7)/(67.0) * 100 = 6.41%. The laboratory reported 6.31%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A02M600D0001 Tot rather than the client ID on the chain of custody, A02MW600D0001 Tot. This validation used the client ID as reported on the chain of custody, A02MW600D0001 Tot.

The laboratory condition upon receipt form noted that the sample label on the sample container for A02MW600D0001 read A05BMW600D0001. The laboratory and this validation memo used A02MW600D0001 as the sample ID.

The laboratory condition upon receipt form noted that the sample label on the sample containers for the matrix spike and matrix spike duplicate (MS/MSD) had an A03 sample prefix rather than A02. The A02 prefix is correct and the laboratory and the validation memo used the A02 prefix for the MS/MSD samples; A02MW50001MS/MSD total and dissolved fractions.

All results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A02M600D0001 Tot rather than the client ID on the chain of custody, A02MW600D0001 Tot. This validation used the client ID as reported on the chain of custody, A02MW600D0001 Tot.

The laboratory condition upon receipt form noted that the sample label on the sample container for A02MW600D0001 read A05BMW600D0001. The laboratory and this validation memo used A02MW600D0001 as the sample ID.

The laboratory condition upon receipt form noted that the sample label on the sample containers for the matrix spike and matrix spike duplicate (MS/MSD) had an A03 sample prefix rather than A02. The A02 prefix is correct and the laboratory and the validation memo used the A02 prefix for the MS/MSD samples; A02MW50001MS/MSD total and dissolved fractions.

Sample Preservation and Holding Times

Samples were collected on 08/22/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1236047 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H240000-047B	0.015	0.032	0.059	0.961
U-235	F1H240000-047B	-0.003	0.005	0.049	-0.999
U-238	F1H240000-047B	-0.004	0.006	0.046	-1.412

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 1236152 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H240000-152B	-0.007	0.008	0.057	-1.728
U-235	F1H240000-152B	0.000	0.012	0.032	0.000
U-238	F1H240000-152B	0.010	0.036	0.077	0.534

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1236047 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 95.2% and 102% respectively. The U-234 and U-238 LCSD recoveries are 95.5% and 99.2% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

LCS/LCSD recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1236152 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100% and 100% respectively. The U-234 and U-238 LCSD recoveries are 104% and 120% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 73-131%.

No results are qualified based upon the LCS/LCSD recoveries.

Matrix Spike Sample Results

No matrix spike samples were analyzed. Recoveries are evaluated from the chemical tracer recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H230407.

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample for batch 1236047. Results are summarized below.

Analyte	F1H240000-047C			F1H240000-047L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.11	0.416	0.044	3.12	0.411	0.051
U-235	0.164	0.085	0.047	0.237	0.100	0.045
U-238	3.47	0.449	0.038	3.36	0.434	0.051

TPU – Total Propagated Uncertainty

The laboratory analyzed a LCS/LCSD pair rather than a laboratory duplicate sample for batch 1236152. Results are summarized below.

Analyte	F1H240000-152C			F1H240000-152L		
	Result pCi/L	**TPU**	**MDA**	**Result pCi/L**	**TPU**	**MDA**
U-234	3.27	0.424	0.063	3.41	0.434	0.056
U-235	0.111	0.070	0.058	0.180	0.086	0.052
U-238	3.40	0.435	0.047	4.09	0.495	0.053

TPU – Total Propagated Uncertainty

U-235 is not present in the LCS/LCSD spike solution. The U-238 laboratory duplicate Z factor is 2.068 and the relative percent difference (RPD) is 18.2%. The QAPP RPD acceptance criteria for the laboratory duplicate is the RPD < 40%.

No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks are properly identified, well defined and adequately resolved.

Calculations

The U-232 tracer recovery for A02MW120001 Diss (F1H230407-003) Batch 1236047

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 358
U-232 Tracer Background Counts: 0.000
U-232 Tracer net counts: 358.00
Count Time: 240 minutes
Detector Efficiency: 26.58%

U-232 Tracer recovered = (358.00)/(240)(0.2658) = 5.612 DPM
U-232 Tracer % Recovery = (5.612 DPM/7.155 DPM) * 100 = 78.44%. The laboratory reported 78.48%.

The U-234 concentration for A02MW120001 Diss (F1H230407-003) Batch 1236047

U-234 gross counts: 119
U-234 background counts: 1.000
U-234 net counts: 118
Count time: 240 minutes
Detector Efficiency: 26.58%
Tracer Recovery: 78.48%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (118.00)/(2.22)(1.000)(240)(0.2658)(0.7848) = 1.06 pCi/L. The laboratory reported 1.06 pCi/L

The U-232 tracer recovery for A02MW120001 Tot (F1H230407-008) Batch 1236152

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 355
U-232 Tracer Background Counts: 0.500
U-232 Tracer net counts: 354.50
Count Time: 240 minutes
Detector Efficiency: 27.22%

U-232 Tracer recovered = (354.50)/(240)(0.2722) = 5.426 DPM
U-232 Tracer % Recovery = (5.426 DPM/7.155 DPM) * 100 = 75.84%. The laboratory reported 75.87%.

The U-238 concentration for A02MW120001 Tot (F1H230407-008) Batch 1236152

U-238 gross counts: 158
U-238 background counts: 0.250
U-238 net counts: 157.75

Count time: 240 minutes
Detector Efficiency: 27.22%
Tracer Recovery: 75.87%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (157.75)/(2.22)(1.000)(240)(0.2722)(0.7587) = 1.43 pCi/L. The laboratory reported 1.43 pCi/L

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A02M600D0001 Tot rather than the client ID on the chain of custody, A02MW600D0001 Tot. This validation used the client ID as reported on the chain of custody, A02MW600D0001 Tot.

The laboratory condition upon receipt form noted that the sample label on the sample container for A02MW600D0001 read A05BMW600D0001. The laboratory and this validation memo used A02MW600D0001 as the sample ID.

The laboratory condition upon receipt form noted that the sample label on the sample containers for the matrix spike and matrix spike duplicate (MS/MSD) had an A03 sample prefix rather than A02. The A02 prefix is correct and the laboratory and the validation memo used the A02 prefix for the MS/MSD samples; A02MW50001MS/MSD total and dissolved fractions.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All results are accepted without qualification. All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The laboratory used an incorrect sample identity. The laboratory used the client sample ID A02M600D0001 Tot rather than the client ID on the chain of custody, A02MW600D0001 Tot. This validation used the client ID as reported on the chain of custody, A02MW600D0001 Tot.

The laboratory condition upon receipt form noted that the sample label on the sample container for A02MW600D0001 read A05BMW600D0001. The laboratory and this validation memo used A02MW600D0001 as the sample ID.

The laboratory condition upon receipt form noted that the sample label on the sample containers for the matrix spike and matrix spike duplicate (MS/MSD) had an A03 sample prefix rather than A02. The A02 prefix is correct and the laboratory and the validation memo used the A02 prefix for the MS/MSD samples; A02MW50001MS/MSD total and dissolved fractions.

Sample Preservation and Holding Times

Samples were collected on 08/22/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection

limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was is 98.7%
No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A02MW50001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1236076. The MS/MSD recoveries are 98.4% and 98.8% respectively.

Sample A02MW50001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1236076. The MS/MSD recoveries are 97.3% and 95.8% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is ≤ 30%.

Sample A02MW50001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1236076. The MS/MSD RPD is 0.4%.

Sample A02MW50001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1236076. The MS/MSD RPD is 1.5%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H230407.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A02MW50001 Diss was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon ICP-MS serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All results are accepted without qualification. All total and dissolved results agree within 20%.

Calculations

Sample A02MW50001 Diss, reported in laboratory data package F1H230407, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 6.2 ug/L
MS uranium concentration: 991 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((991 ug/L – 6.2 ug/L)/ 1000 ug/L)) * 100 = 98.5%. The laboratory reported 98.8%.

Serial Dilution:
Sample uranium concentration: 6.2 ug/L
Serial dilution concentration of the 5X dilution: 6.1 ug/L
ICP-MS Serial Dilution Percent Difference = ((6.2-6.1)/(6.2) * 100 = 1.6%. The laboratory reported 0.91%. The sample concentration is too low to evaluate the ICP-MS serial dilution results.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory used an incorrect sample ID. The laboratory used a sample ID of A03MW607D001 Tot (F1H230464-001) rather than A03MW607D0001 Tot; the sample ID on the chain of custody. The validation used the A03MW607D0001 Tot ID.

All isotopic uranium results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates were recorded for all field samples. Sampling times were not recorded for sample A03MW9004. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The laboratory used an incorrect sample ID. The laboratory used a sample ID of A03MW607D001 Tot (F1H230464-001) rather than A03MW607D0001 Tot; the sample ID on the chain of custody. The validation used the A03MW607D0001 Tot ID.

Sample Preservation and Holding Times

Samples were collected on 08/19/2011. The condition upon receipt form indicates that all aqueous metal samples were properly preserved except for A03MW607D0001 Tot and A03MW703DD0001. The laboratory noted that these samples were received at a pH of 7. The laboratory added sufficient nitric acid to lower the pH to < 2. The pH was adjusted on 08/23/2011 and the samples were prepared for analysis on 08/26/2011.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1238042 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H260000-042B	0.007	0.027	0.060	0.493
U-235	F1H260000-042B	-0.0027	0.0055	0.050	-0.999
U-238	F1H260000-042B	0.009	0.026	0.056	0.664

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 1238069 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H260000-069B	0.021	0.029	0.045	1.452
U-235	F1H260000-069B	0.004	0.019	0.047	0.471
U-238	F1H260000-069B	0.004	0.015	0.038	0.471

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1238042 are summarized below. The laboratory did not analyze a LCSD because a MS/MSD pair was analyzed.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 97.2% and 94.4% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 75-131%.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 1238069 are summarized below. The laboratory did not analyze a LCSD because a MS/MSD pair was analyzed.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 93.8% and 99.2% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 75-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

Guterl Steel sample A03MW703DD0001 Tot (F1H230464-002) was analyzed as the batch 1238042 MS/MSD pair. All MS/MSD recoveries were within the QAPP acceptance criteria, 59-150%. U-235 is not part of the MS/MSD spike solution.

Guterl Steel sample A03MW703DD0001 Diss (F1H230464-10)) was analyzed as the batch 1238069 MS/MSD pair. All MS/MSD recoveries were within the QAPP acceptance criteria, 59-150%. U-235 is not part of the MS/MSD spike solution.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples A03MW16D0001Tot and A03MW9004 Tot are a field duplicate pair. Results are summarized below.

Analyte	A03MW16D0001 Tot			A03MW9004 Tot		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	8.8	1.0	0.09	8.38	0.95	0.08
U-235	0.44	0.18	0.08	0.42	0.16	0.08
U-238	9.7	1.1	0.07	8.88	0.99	0.06

TPU – Total Propagated Uncertainty

Samples A03MW16D0001Diss and A03MW9004 Diss are a field duplicate pair. Results are summarized below.

Analyte	A03MW16D0001 Diss			A03MW9004 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	8.9	1.0	0.06	9.2	1.0	0.06
U-235	0.45	0.18	0.05	0.58	0.20	0.04
U-238	10.2	1.1	0.04	10.1	1.1	0.08

TPU – Total Propagated Uncertainty

No results are qualified based upon the field duplicate results.

Laboratory Duplicates

The MS/MSD results are evaluated as laboratory duplicate samples.
The laboratory analyzed sample A03MW703DD0001 Tot (F1H230464-2) as the laboratory MS/MSD pair for analytical batch 1238042. Results are summarized below.

Analyte	A03MW703DD0001 Tot MS			A03MW703DD0001 Tot MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.588	0.3495	0.077	3.119	0.430	0.067
U-235	0.180	0.101	0.071	0.135	0.081	0.052
U-238	3.338	0.471	0.073	3.135	0.340	0.025

TPU – Total Propagated Uncertainty

The laboratory analyzed sample A03MW703DD0001 Diss (F1H230464-10) as the laboratory MS/MSD pair for analytical batch 1238069. Results are summarized below.

Analyte	A03MW703DD0001 Diss MS			A03MW703DD0001 Diss MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.115	0.450	0.057	2.712	0.397	0.062
U-235	0.130	0.085	0.061	0.090	0.069	0.064
U-238	3.176	0.455	0.049	2.837	0.408	0.051

TPU – Total Propagated Uncertainty

No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A03MW16D0001 Tot (F1H230464-003) Batch 1238042

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 234
U-232 Tracer Background Counts: 1.250
U-232 Tracer net counts: 232.75
Count Time: 240 minutes
Detector Efficiency: 26.42%

U-232 Tracer recovered = (232.75)/(240)(0.2642) = 3.671 DPM
U-232 Tracer % Recovery = (3.671 DPM/7.155 DPM) * 100 = 51.30%. The laboratory reported 51.33%.

The U-234 concentration for A03MW16D0001 Tot (F1H230464-003) Batch 1238042

U-234 gross counts: 634
U-234 background counts: 1.250
U-234 net counts: 632.75
Count time: 240 minutes
Detector Efficiency: 26.42%
Tracer Recovery: 51.33%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (632.75)/(2.22)(1.000)(240)(0.2642)(0.5130) = 8.76 pCi/L. The laboratory reported 8.77 pCi/L.

The U-232 tracer recovery for A03MW703DD0001 Diss MS (F1H230464-010S) Batch 1238069

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 334
U-232 Tracer Background Counts: 0.75
U-232 Tracer net counts: 333.25

Count Time: 240 minutes
Detector Efficiency: 28.11%

U-232 Tracer recovered = (333.25)/(240)(0.2811) = 4.940 DPM
U-232 Tracer % Recovery = (4.940 DPM/7.155 DPM) * 100 = 69.03%. The laboratory reported 69.07%.

The U-238 concentration for A03MW703DD0001 Diss MS (F1H230464-010S) Batch 1238069

U-238 gross counts: 294
U-238 background counts: 0.500
U-238 net counts: 293.50
Count time: 240 minutes
Detector Efficiency: 28.11%
Tracer Recovery: 69.07%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute
CPM = Counts/minute

U-238 Concentration: = (293.50)/(2.22)(1.000)(240)(0.2811)(0.6907) = 2.837 pCi/L. The laboratory reported 2.837 pCi/L.

Matrix spike added: (75.26CPM/ml)(0.10 mL)(1.0 pCi/2.22 CPM)(1.000 Liters) = 3.39 pCi/L

Matrix Spike % Recovery : (Concentration measured)/(Calculated Concentration) * 100 = (2.837 pCi/L)/(3.39 pCi/L) * 100 = 83.7%. The laboratory reported the MS recovery 83.7%.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data*

Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Samples were collected on 08/19/2011. The condition upon receipt form indicates that all aqueous metal samples were properly preserved except for A03MW607D0001 Tot and A03MW703DD0001. The laboratory noted that these samples were received at a pH of 7. The laboratory added sufficient nitric acid to lower the pH to < 2. The pH was adjusted on 08/23/2011 and the sample was prepared for analysis on 08/24/2011.

The laboratory used an incorrect sample ID. The laboratory used a sample ID of A03MW607D001 Tot (F1H230464-001) rather than A03MW607D0001 Tot; the sample ID on the chain of custody. The validation used the A03MW607D0001 Tot ID.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A03MW703DD0001 Tot is qualified as estimated (J). The reported result is between the method detection limit (MDL) and RL.

All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates were recorded for all field samples. Sampling times were not recorded for sample A03MW9004. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The laboratory used an incorrect sample ID. The laboratory used a sample ID of A03MW607D001 Tot (F1H230464-001) rather than A03MW607D0001 Tot; the sample ID on the chain of custody. The validation used the A03MW607D0001 Tot ID.

Sample Preservation and Holding Times

Samples were collected on 08/19/2011. The condition upon receipt form indicates that all aqueous metal samples were properly preserved except for A03MW607D0001 Tot and A03MW703DD0001. The laboratory noted that these samples were received at a pH of 7. The laboratory added sufficient nitric acid to lower the pH to < 2. The pH was adjusted on 08/23/2011 and the samples were prepared for analysis on 08/24/2011.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was 98.7%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A03MW703DD0001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1236077. The MS/MSD recoveries are 109% and 109% respectively.

Sample A03MW703DD0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1236077. The MS/MSD recoveries are 103% and 101% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is ≤ 30%.

Sample A03MW703DD0001 Tot was analyzed as the MS/MSD pair associated with preparation batch 1236077. The MS/MSD relative percent difference is 0.46%.

Sample A03MW703DD0001 Diss was analyzed as the MS/MSD pair associated with preparation batch 1236077. The MS/MSD relative percent difference is 1.3%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples A03MW16D0001/A03MW9004 total and dissolved fractions are two field duplicate pairs. The field duplicate RPDs are less than 50%. The RPDs are 3.1% and 1.8% respectively.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10%, results are qualified as estimated (J).

Sample A03MW703DD0001 Tot was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	0.28	1.2 U	NC	None

The uranium sample concentration is less than 50X the IDL. The concentration is too low to evaluate the serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All total and dissolved results agree within 20%.

The uranium result for A03MW703DD0001 Tot is qualified as estimated (J). The reported result is between the MDL and RL.

Calculations

Sample A03MW703DD0001 Tot, reported in laboratory data package F1H230464, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 0.28 ug/L
MS uranium concentration: 1090 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1090 ug/L – 0.28 ug/L)/ 1000 ug/L)) * 100 = 109%. The laboratory reported 109.4%.

Serial Dilution:
Sample uranium concentration: 0.28 ug/L
Serial dilution concentration of the 5X dilution: 1.2 ug/L (U)
ICP-MS Serial Dilution Percent Difference = Not Calculated. The ICP-MS serial dilution result is reported as non-detected (U) at 1.2 ug/L. The uranium IDL is 0.23 ug/L.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/23/2011. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 1238069 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F1H260000-069B	0.021	0.029	0.045	1.452
U-235	F1H260000-069B	0.004	0.019	0.047	0.471
U-238	F1H260000-069B	0.004	0.015	0.038	0.471

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch

1238069 are summarized below. The laboratory did not analyze a LCSD because a MS/MSD pair was analyzed.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 93.8% and 99.2% respectively. U-235 is not a spiked isotope. All LCS/LCSD recoveries are within the QAPP acceptance criteria; 75-131%.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

Guterl Steel sample A03MW703DD0001 Diss (F1H230464-10) reported in laboratory data package F1H230464) was analyzed as the batch 1238069 MS/MSD pair. All MS/MSD recoveries were within the QAPP acceptance criteria, 59-150%. U-235 is not part of the MS/MSD spike solution.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H240450.

No results are qualified based upon the absence of field duplicate results.

Laboratory Duplicates

The laboratory analyzed sample A03MW703DD0001 Diss (F1H230464-10) reported in laboratory data package F1H230464) as the laboratory MS/MSD pair for analytical batch 1238069. Results are summarized below.

Analyte	A03MW703DD0001 Diss MS			A03MW703DD0001 Diss MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.115	0.450	0.057	2.712	0.397	0.062
U-235	0.130	0.085	0.061	0.090	0.069	0.064
U-238	3.176	0.455	0.049	2.837	0.408	0.051

TPU – Total Propagated Uncertainty

No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A02MW9005 Tot (F1H240450-001) Batch 1238069

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 308
U-232 Tracer Background Counts: 1.500
U-232 Tracer net counts: 306.50
Count Time: 240 minutes
Detector Efficiency: 26.47%

U-232 Tracer recovered = (306.50)/(240)(0.2647) = 4.824 DPM
U-232 Tracer % Recovery = (4.824 DPM/7.155 DPM) * 100 = 67.42%. The laboratory reported 67.46%.

The U-234 concentration for A02MW9005 Tot (F1H240450-001) Batch 1238069

U-234 gross counts: 1039
U-234 background counts: 1.750
U-234 net counts: 137.25
Count time: 240 minutes
Detector Efficiency: 26.47%
Tracer Recovery: 67.46%
Sample volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (1037.25)/(2.22)(1.000)(240)(0.2647)(0.6745) = 10.90 pCi/L. The laboratory reported 10.90 pCi/L

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time

	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The condition upon receipt form indicates that all aqueous metal samples were properly preserved except for A04BMW707DD0001 Tot. The laboratory noted that this sample was received at an improper pH. The laboratory added sufficient nitric acid to lower the pH to < 2. The pH was adjusted on 08/24/2011 and the sample was prepared for analysis on 08/25/2011.

The ICP-MS serial dilution % difference was 20.3%. Uranium results for A02MW9005 Tot, A02MW010001 Tot, A02MW020001 Tot, A02MW9005 Diss, A02MW010001 Diss and A02MW020001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased high. Sample A04BMW707DD0001 Tot was analyzed at a 5 X dilution. Using professional judgment the uranium result for A04BMW707DD0001 Tot was not qualified.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

Sample A04BMW707DD0001 Tot was analyzed at a 5X dilution.

All results are accepted without qualification. All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates were recorded for all field samples. Sampling times were not recorded for samples A02MW9005 Total and Dissolved and A04BMW707DD0001. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/23/2011. The condition upon receipt form indicates that all aqueous metal samples were properly preserved except for A04BMW707DD0001 Tot. The laboratory noted that this sample was received at an improper pH. The laboratory added sufficient nitric acid to lower the pH to < 2. The pH was adjusted on 08/24/2011 and the sample was prepared for analysis on 08/25/2011.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recoveries were 102.7% and 98.0%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A02MW9005 Tot was analyzed as the MS/MSD pair associated with preparation batch 1237036. The MS/MSD recoveries are 109% and 107% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample A02MW9005 Tot was analyzed as the MS/MSD pair associated with preparation batch 1237036. The MS/MSD RPD is 2.0%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1H240450.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample A02MW9005 Tot was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	40.1	31.9	20.3%	J+

Uranium results for A02MW9005 Tot, A02MW010001 Tot, A02MW020001 Tot, A02MW9005 Diss, A02MW010001 Diss and A02MW020001 Diss are qualified as estimated (J). Matrix interferences are indicated. The reported results may be biased high. Sample A04BMW707DD0001 Tot was analyzed at a 5 X dilution. Using professional judgment the uranium result for A04BMW707DD0001 Tot was not qualified.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All total and dissolved results agree within 20%.

Sample A04BMW707DD0001 Tot was analyzed at a 5X dilution.

Calculations

Sample A02MW9005 Tot, reported in laboratory data package F1H240450, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 40.1 ug/L
MS uranium concentration: 1130 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1130 ug/L – 40.1 ug/L)/ 1000 ug/L)) * 100 = 109%. The laboratory reported 109.2%.

Serial Dilution:
Sample uranium concentration: 40.1 ug/L
Serial dilution concentration of the 5X dilution: 31.9 ug/L
ICP-MS Serial Dilution Percent Difference = ((40.1-31.9)/(40.1) * 100 = 20.4%. The laboratory reported 20.3%. The uranium IDL is 0.23 ug/L.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

DUP- Laboratory Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium and isotopic thorium analytical data from aqueous and solid samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy (EML A-01-R-MOD), according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are Th-228, Th-230, Th-232, U-234, U-235 and U-238. The solid sample results are reported on a dry weight basis.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007,* the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in

conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the isotopic thorium and isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Using professional judgment the Th-230 results for AQUEOUS IDW and AQUEOUS IDW DUP are qualified as estimated (J). These Th-230 results are summarized below. Statistically these results are equal to the positive method blank result. Both the positive sample results and positive method blank results are less than the laboratory reporting limit 0.10 pCi/L.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 08/31/2011. The condition upon receipt form indicates that aqueous radionuclide samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Solid method blank results associated with preparation batches 1249210 and 1249211 are summarized below.

Radionuclide	Sample ID	Conc pCi/g	Total Uncertainty pCi/g	MDC pCi/g	Z-Factor
Th-228	F1I060000-210B	0.024	0.021	0.025	2.2251
Th-230	F1I060000-210B	0.021	0.020	0.023	2.0952
Th-232	F1I060000-210B	-0.001	0.002	0.018	-0.9991
U-234	F1I060000-211B	-0.0009	0.0086	0.026	-0.2182
U-235	F1I060000-211B	-0.0023	0.0033	0.025	-1.4117
U-238	F1I060000-211B	0.008	0.011	0.010	1.4117

MDC- Minimal Detectable Concentration

All method blank results are reported as non-detected (U).

Aqueous method blank results associated with preparation batches 1251056 and 1251057 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDC pCi/L	Z-Factor
Th-228	F1I080000-056B	0.012	0.023	0.041	1.0399
Th-230	F1I080000-056B	0.085	0.053	0.036	3.2027
Th-232	F1I080000-056B	-0.0020	0.0039	0.036	-0.9991
U-234	F1I080000-057B	0.058	0.050	0.059	2.3300
U-235	F1I080000-057B	-0.0053	0.0076	0.057	-1.4117
U-238	F1I080000-057B	0.017	0.024	0.023	1.4117

MDC- Minimal Detectable Concentration

Using professional judgment the Th-230 results for AQUEOUS IDW and AQUEOUS IDW DUP are qualified as estimated (J). These Th-230 results are summarized below

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDC pCi/L
Th-230	AQUEOUS IDW	0.077	0.050	0.036
Th-230	AQUEOUS IDW DUP	0.098	0.064	0.045

Statistically these results are equal to the positive method blank result. Both the positive sample results and positive method blank results are less than the laboratory reporting limit 0.10 pCi/L.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batches 1249210, 1249211, 1251056 and 1251057 are summarized below. The laboratory did not analyze a LCSD. The laboratory did analyze a laboratory duplicate pair for each isotope in each matrix.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

All LCS recoveries are within the QAPP acceptance criteria and the laboratory derived acceptance criteria. U-235, Th-228 and Th-232 are not LCS spiked isotopes.

No results are qualified based upon the LCS recoveries.

Matrix Spike Sample Results

No MS/MSDs were analyzed. The laboratory analyzed a LCS and laboratory duplicate samples for each sample matrix.

No results are qualified due to the absence of MS/MSD results.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1I010435.

No results are qualified based upon the absence of field duplicate results.

Laboratory Duplicates

The laboratory analyzed aqueous sample AQUEOUS IDW (F1I010435-001) as the laboratory duplicate pair for analytical batches 1251056 and 1251057. Results are summarized below.

Analyte	AQUEOUS IDW			AQUEOUS IDW DUP		
	Result pCi/L	TPU	MDC	Result pCi/L	TPU	MDC
Th-228	0.022 U	0.028	0.036	0.037 U	0.040	0.045
Th-230	0.077 J	0.050	0.036	0.098 J	0.064	0.045
Th-232	0.028 U	0.032	0.039	0.017 U	0.029	0.045
U-234	0.102	0.062	0.054	0.093	0.063	0.052
U-235	0.011 U	0.021	0.029	0.003 U	0.027	0.072
U-238	0.082	0.054	0.038	0.088	0.063	0.062

TPU – Total Propagated Uncertainty

No aqueous results are qualified based upon the laboratory duplicate precision.

The laboratory analyzed solid sample NON-AQUEOUS IDW (F1I010435-002) as the laboratory duplicate pair for analytical batches 1249210 and 1249211. Results are summarized below.

Analyte	NON-AQUEOUS IDW			NON-AQUEOUS IDW DUP		
	Result pCi/g	TPU	MDC	Result pCi/g	TPU	MDC
Th-228	0.355	0.105	0.048	0.318	0.096	0.048
Th-230	0.400	0.111	0.030	0.379	0.130	0.029
Th-232	0.259	0.088	0.032	0.244	0.081	0.029
U-234	0.337	0.079	0.021	0.303	0.073	0.017
U-235	0.009 U	0.014	0.023	0.014	0.016	0.013
U-238	0.322	0.077	0.011	0.417	0.087	0.010

TPU – Total Propagated Uncertainty

No solid results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for NON-AQUEOUS IDW (F1I010435-002) Batch 1249211

U-232 Tracer concentration: 71.55 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.155 DPM
U-232 Tracer Gross Counts: 405
U-232 Tracer Background Counts: 0.5000
U-232 Tracer net counts: 404.50
Count Time: 240 minutes
Detector Efficiency: 28.11%

U-232 Tracer recovered = (404.50)/(240)(0.0.2811) = 5.995 DPM

U-232 Tracer % Recovery = (5.995 DPM/7.155 DPM) * 100 = 83.8%. The laboratory reported 83.9%.

The Th-229 tracer recovery for AQUEOUS IDW (F1I010435-001) Batch 1251056

Th-229 Tracer concentration: 63.40 DPM/mL (DPM = disintegrations/minute)
Th-229 Tracer volume: 0.10 mL
Th-229 Tracer added: 6.340 DPM
Th-229 Tracer Gross Counts: 363
Th-229 Tracer Background Counts: 0.000
Th-229 Tracer net counts: 363
Count Time: 240 minutes
Detector Efficiency: 27.43%

Th-229 Tracer recovered = (363)/(240)(0.2743) = 5.514 DPM
Th-229 Tracer % Recovery = (5.514 DPM/6.34 DPM) * 100 = 87.0%. The laboratory reported 87.3%.

The U-234 concentration for NON-AQUEOUS IDW (F1I010435-002) Batch 1249211

U-234 gross counts: 85
U-234 background counts: 0.500
U-234 net counts: 84.5
Count time: 240 minutes
Detector Efficiency: 28.11%
Tracer Recovery: 83.87%
Sample Mass: 2.000 grams
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (84.5)/(2.22)(2.000)(240)(0.2811)(0.8378) = 0.337 pCi/g. The laboratory reported 0.337 pCi/g

The Th-230 concentration for LCS (F1I080000-056C) Batch 1251056

Th-230 gross counts: 292
Th-230 background counts: 0.500
Th-230 net counts: 291.50
Count time: 240 minutes
Detector Efficiency: 27.61%
Tracer Recovery: 89.11%
Sample Volume: 1.000 Liter
1 picocurie = 2.22 counts/minute

Th-230 Concentration: = (291.5)/(2.22)(1.000)(240)(0.2761)(0.89115) = 2.224 pCi/L. The laboratory reported 2.23 pCi/L. The laboratory spike concentration added is 2.37 pCi/L. The LCS calculated recovery is (2.22/2.37)* 100 = 93.6%. The laboratory reported the LCS Th-230 recovery at 94%.

Table 1summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration
	X	Low Level Initial Calibration Verification (CRDL)
	X	Blank Analyses
	X	Interference Check Sample Results
	X	Matrix and Matrix Spike Duplicate Recoveries
	X	Laboratory Duplicate Precision
	X	Laboratory Control Samples (Blank Spike)
	NA	Field Duplicate Precision
	X	ICP-MS Serial Dilutions
	X	ICP-MS Internal Standard Recoveries
X		Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for AQUEOUS IDW is qualified as estimated (J). The reported result is between the method detection limit (MDL) and RL.

All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

The COC noted that the A04BMW707DD0001 Tot sample bottle listed only total metals for analysis. This bottle was also logged in for total uranium.

Sample Preservation and Holding Times

Samples were collected on 08/31/2011. The condition upon receipt form indicates that all aqueous metal samples were properly preserved.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was 97.0%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample AQUEOUS IDW was analyzed as the MS/MSD pair associated with preparation batch 1249123. The MS/MSD recoveries are 106% and 107% respectively.

All MS/MSD recoveries were within the 75-125% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 30%.

Sample AQUEOUS IDW was analyzed as the MS/MSD pair associated with preparation batch 1249123. The MS/MSD relative percent difference is 1.0%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F1I010435.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-120%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. If the %D exceeds 10% results are qualified as estimated (J).

Sample AQUEOUS IDW was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	0.28	1.2 U	NC	None

The uranium sample concentration is less than 50X the IDL. The concentration is too low to evaluate the serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for AQUEOUS IDW is qualified as estimated (J). The reported result is between the method detection limit (MDL) and RL.

All total and dissolved results agree within 20%.

Calculations

Sample AQUEOUS IDW was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 0.28 ug/L
MS uranium concentration: 1060 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1060 ug/L – 0.28 ug/L)/ 1000 ug/L)) * 100 = 106%. The laboratory reported 105.6%.

Serial Dilution:
Sample uranium concentration: 0.28 ug/L
Serial dilution concentration of the 5X dilution: 1.2 ug/L (U)
ICP-MS Serial Dilution Percent Difference = Not Calculated. The ICP-MS serial dilution result is reported as non-detected (U) at 1.2 ug/L. The uranium IDL is 0.23 ug/L.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-*

Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The minimal detectable concentrations (MDCs) are elevated for sample A04DMW708DD0002 Tot. As noted in the narrative "The Uranium sample did not meet the CRDL due to a reduced sample volume." The laboratory prepared 258.35 milliliters rather than 500 milliliters.

All isotopic uranium results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 01/30/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 2033010 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2B020000-010B	0.011	0.0205	0.037	1.028
U-235	F2B020000-010B	-0.0022	0.0044	0.040	-0.999
U-238	F2B020000-010B	-0.0018	0.0035	0.032	-0.999

MDA- Minimal Detectable Activity

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2033010 are summarized below. The laboratory did analyze a LCSD because a MS/MSD pair was not analyzed.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 LCS/LCSD recoveries are 96.3% and 92.6% respectively. The U-238 LCS/LCSD recoveries are 104% and 93.2% respectively. U-235 is not a spiked isotope.

All LCS/LCSD recoveries are within the QAPP acceptance criteria.

Matrix Spike Sample Results

No MS/MSDs were analyzed. The laboratory analyzed a LCS/LCSD pair.

No results are qualified due to the absence of MS/MSD results.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F2B010413.

No results are qualified based upon the absence of field duplicate results.

Laboratory Duplicates

The LCS/LCSD results are evaluated as laboratory duplicate samples.

The laboratory analyzed samples F2B020000-010C/F2B020000-010L as the laboratory LCS/LCSD pair for analytical batch 2033010. Results are summarized below. U-235 is not a spiked isotope.

Analyte	F2B020000-010C			F2B020000-010L		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	3.153	0.405	0.0436	3.022	0.387	0.0417
U-235	0.173	0.082	0.0418	0.246	0.095	0.0238
U-238	3.533	0.323	0.0392	3.159	0.400	0.0509

TPU – Total Propagated Uncertainty

No results are qualified based upon the laboratory duplicate precision.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04DMW710D0002 Diss (F2B010413-001) Batch 2033010

U-232 Tracer concentration: 71.13 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.113 DPM
U-232 Tracer Gross Counts: 342.5
U-232 Tracer Background Counts: 0.500
U-232 Tracer net counts: 342
Count Time: 240 minutes
Detector Efficiency: 28.11%

U-232 Tracer recovered = (342.0)/(240)(0.2811) = 5.069 DPM

U-232 Tracer % Recovery = (5.069 DPM/7.113 DPM) * 100 = 71.27%. The laboratory reported 71.28%.

The U-234 concentration for A04DMW710D0002 Diss (F2B010413-001) Batch 2033010

U-234 gross counts: 925
U-234 background counts: 1.000
U-234 net counts: 924.0
Count time: 240 minutes
Detector Efficiency: 28.11%
Tracer Recovery: 71.28%
Sample volume: 0.500 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (925)/(2.22)(0.500)(240)(0.2811)(0.7128) = 17.33 pCi/L. The laboratory reported 17.34 pCi/L.

Total and dissolved results agree within 20%.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The minimal detectable concentrations (MDCs) are elevated for samples A04BMW605D0002 Tot, A04BMW9006 Tot, A04BMW605D0002 Diss and A04BMW9006 Diss. As noted in the narrative "The Uranium sample did not meet the CRDL due to a reduced sample volume."

Using professional judgment the U-234 and U-238 results for A04BMW260002 Tot and A04BMW260002 Diss are qualified as estimated (J). These results are summarized below.

Analyte	A04BMW260002 Tot			A04BMW260002 Diss		
	Result pCi/L	**TPU**	**MDA**	**Result pCi/L**	**TPU**	**MDA**
U-234	39.7	3.7	0.1	48.4	4.5	0.1
U-238	38.3	3.6	0.05	48.4	4.5	0.1

The U-234 and U-238 results for the dissolved fractions are greater than the total fractions. The percent differences between the dissolved and total fractions exceed 20%.

Using professional judgment the U-234 results for A04BMW707DD0002 Tot and A04BMW707DD0002 Diss are qualified as estimated (J). These results are summarized below.

Analyte	A04DMW707DD0002 Tot			A04DMW707DD0002 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	7.76	0.98	0.08	14.5	1.6	0.1

The U-234 result for A04BMW707DD0002 Diss is nearly 2X the U-234 result for A04DMW707DD0002 Tot.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 02/01/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time is 180 days. The analytical holding time was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Initial Calibration Verification Results

All criteria were met. All recoveries are within 95-105% of the initial calibrations.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 2038119 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2B070000-119B	0.011	0.0208	0.038	1.028
U-235	F2B070000-119B	0.009	0.0178	0.024	0.999
U-238	F2B070000-119B	0.007	0.0142	0.019	0.999

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 2038127 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2B070000-127B	0.0367	0.0332	0.020	2.226
U-235	F2B070000-127B	0.0092	0.0184	0.025	0.999
U-238	F2B070000-127B	0.0074	0.0148	0.020	0.999

MDA- Minimal Detectable Activity

The U-234 result for method blank F2B070000-127B is a positive result. The U-234 method blank result is significantly less than the sample concentrations.

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2038119 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100.4% and 104.0% respectively. U-235 is not a spiked isotope.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2038127 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 93.1% and 96.8% respectively. U-235 is not a spiked isotope.

All LCS recoveries are within the QAPP acceptance criteria.

Matrix Spike Sample Results

No MS/MSDs were analyzed. The laboratory analyzed laboratory duplicate pairs.

No results are qualified due to the absence of MS/MSD results.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples A04BMW605D0002 Tot and A04BMW9006 Tot are a field duplicate pair. Results are summarized below.

Analyte	A04BMW605D0002 Tot			A04BMW9006 Tot		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	87.3	7.9	0.2	101	9.2	0.2
U-235	3.59	0.75	0.09	5.3	1.0	0.2

U-238	23.8	2.3	0.07	21.5	2.0	0.09

TPU – Total Propagated Uncertainty

No results are qualified based upon the laboratory duplicate precision. The RPDs are less than 40%.

The laboratory analyzed sample A04DMW704DD0002 Diss (F2B030480-011) as the laboratory duplicate pair for analytical batch 2038127.

Analyte	A04DMW704DD0002 Diss			A04DMW704DD0002 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	26.3	2.5	0.08	30.0	2.8	0.09
U-235	1.15	0.27	0.04	1.26	0.29	0.08
U-238	22.6	2.1	0.06	24.1	2.3	0.08

TPU – Total Propagated Uncertainty

No results are qualified based upon the laboratory duplicate precision. The RPDs are less than 40%.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04BMW9006 Tot (F2B030480-005) Batch 2038119

U-232 Tracer concentration: 71.13 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.113 DPM
U-232 Tracer Gross Counts: 210
U-232 Tracer Background Counts: 1.75
U-232 Tracer net counts: 208.25
Count Time: 240 minutes
Detector Efficiency: 27.19%

U-232 Tracer recovered = (208.25)/(240)(0.2719) = 3.191 DPM
U-232 Tracer % Recovery = (3.191 DPM/7.113 DPM) * 100 = 44.86%. The laboratory reported 44.82%.

The U-234 concentration for A04BMW9006 Tot (F2B030480-005) Batch 2038119

U-234 gross counts: 3271
U-234 background counts: 0.5000
U-234 net counts: 3270.50
Count time: 240 minutes
Detector Efficiency: 27.19%
Tracer Recovery: 44.82%
Sample volume: 0.5003 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (3270.5)/(2.22)(0.5003)(240)(0.2719)(0.4482) = 100.6 pCi/L. The laboratory reported 100.9 pCi/L.

The U-232 tracer recovery for A04BMW9006 Diss (F2B030480-012) Batch 2038127

U-232 Tracer concentration: 71.13 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.113 DPM
U-232 Tracer Gross Counts: 223
U-232 Tracer Background Counts: 2.00
U-232 Tracer net counts: 221.00
Count Time: 240 minutes
Detector Efficiency: 27.86%

U-232 Tracer recovered = (221.00)/(240)(0.2786) = 3.305 DPM
U-232 Tracer % Recovery = (3.305 DPM/7.113 DPM) * 100 = 46.47%. The laboratory reported 44.42%.

The U-234 concentration for A04BMW9006 Diss (F2B030480-012) Batch 2038127

U-234 gross counts: 3115
U-234 background counts: 0.5000
U-234 net counts: 3114.50
Count time: 240 minutes
Detector Efficiency: 27.86%
Tracer Recovery: 46.42%
Sample volume: 0.5002 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (3114.5)/(2.22)(0.5002)(240)(0.2786)(0.4642) = 90.4 pCi/L. The laboratory reported 90.6 pCi/L.

Using professional judgment the U-234 and U-238 results for A04BMW260002 Tot and A04BMW260002 Diss are qualified as estimated (J). These results are summarized below.

Analyte	A04BMW260002 Tot			A04BMW260002 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	39.7	3.7	0.1	48.4	4.5	0.1
U-238	38.3	3.6	0.05	48.4	4.5	0.1

The U-234 and U-238 results for the dissolved fractions are greater than the total fractions. The percent differences between the dissolved and total fractions exceed 20%.

Using professional judgment the U-234 results for A04BMW707DD0002 Tot and A04BMW707DD0002 Diss are qualified as estimated (J). These results are summarized below.

Analyte	A04DMW707DD0002 Tot			A04DMW707DD0002 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	7.76	0.98	0.08	14.5	1.6	0.1

The U-234 result for A04BMW707DD0002 Diss is nearly 2X the U-234 result for A04DMW707DD0002 Tot.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The uranium results for A04DMW710D0002 Diss, A04DMW710DD0002 Diss, A04DMW713D0002 Diss, A04DMW708DD0002 Diss, A04DMW710D0002 Tot, A04DMW710DD0002 Tot, A04DMW713D0002 Tot and A04DMW708DD0002 Tot are qualified as estimated (J). The ICP-MS serial dilution % Difference is 11.2%. The reported results may be biased high.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A04DMW713D0002 Diss is qualified as estimated (J). The reported result is between the MDL (0.23 ug/L) and 2X the MDL.

All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 01/30/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery was is 97.3%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW710D0002 Diss was analyzed as the MS/MSD pair associated with preparation batch 2034044. The MS/MSD recoveries are 108.4% and 108.7% respectively.

All MS/MSD recoveries were within the 70-130% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 20%.

Sample A04DMW710D0002 Diss was analyzed as the MS/MSD pair associated with preparation batch 2034044. The MS/MSD RPD is 0.25%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

No field duplicate pair was reported in laboratory data package F2B010413.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 80-115%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. The IDL is 0.23 ug/L. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW710D0002 Diss was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	57.8	51.3	11.2%	J

All uranium results are qualified as estimated (J) based upon ICP-MS serial dilution results. The reported results may be biased high.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A04DMW713D0002 Diss is qualified as estimated (J). The reported result is between the MDL (0.23 ug/L) and 2X the MDL.

All total and dissolved results agree within 20%.

Calculations

Sample A04DMW710D0002 Diss, reported in laboratory data package F2B010413, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 57.8 ug/L
MS uranium concentration: 1140 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1140 ug/L – 57.8 ug/L)/ 1000 ug/L)) * 100 = 108.2%. The laboratory reported 108.4%.

Serial Dilution:
Sample uranium concentration: 57.8 ug/L
Serial dilution concentration of the 5X dilution: 51.3 ug/L
ICP-MS Serial Dilution Percent Difference = ((57.8-51.3)/(57.8) * 100 = 11.2%. The laboratory reported 11.2%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

The uranium results for all samples are qualified as estimated (J). The ICP-MS serial dilution % Difference is 14.2%. The reported uranium results may be biased high.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 02/01/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration was 1.0 ug/L. The CRDL recovery was is 90.0%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL) 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW704DD0002 Tot was analyzed as a MS/MSD pair associated with preparation batch 2037060. The MS/MSD recoveries are 107.9% and 119.6% respectively.

Sample A04DMW704DD0002 Diss was analyzed as a MS/MSD pair associated with preparation batch 2037060. The MS/MSD recoveries are 111.7% and 111.3% respectively.

All MS/MSD recoveries were within the 70-130% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 20%.

Sample A04DMW704DD0002 Tot was analyzed as a MS/MSD pair associated with preparation batch 2037060. The MS/MSD RPD is 9.6%.

Sample A04DMW704DD0002 Diss was analyzed as a MS/MSD pair associated with preparation batch 2037060. The MS/MSD RPD is 0.3%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

Samples A04BMW605D0002/A04BMW9006 total and dissolved fractions are two field duplicate pairs. The field duplicate RPDs are less than 50%. The RPDs are 0.3% and 0.7% respectively.

No results are qualified based upon the absence of field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 85-115%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. The IDL is 0.23 ug/L. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW704DD0002 Tot was analyzed as the ICP-MS serial dilution sample. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
Uranium	81.3	69.7	14.2%	J

All uranium results are qualified as estimated (J) based upon ICP-MS serial dilution results. The reported results may be biased high.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

All total and dissolved results agree within 20%.

Calculations

Sample A04DMW704DD0002 Tot, reported in laboratory data package F2B0030480, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 81.3 ug/L
MS uranium concentration: 1160 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1160 ug/L – 81.3 ug/L)/ 1000 ug/L)) * 100 = 107.92%. The laboratory reported 107.9%.

Serial Dilution:
Sample uranium concentration: 81.3 ug/L
Serial dilution concentration of the 5X dilution: 69.7 ug/L
ICP-MS Serial Dilution Percent Difference = ((81.3-69.7)/(81.3) * 100 = 14.2%. The laboratory reported 14.2%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240)*. The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	Initial Calibrations
	X	Initial Calibration Verifications
	X	Daily Pulser Checks
	X	Blank Results
	X	Sample Specific Tracer Recoveries
	X	Laboratory Control Samples
	X	Matrix Spike Results
	X	Field Replicate Results
	X	Laboratory Duplicate Results
	X	Radionuclide Quantitation and Minimal Detectable Activities
	X	Spectrometry Resolution
	X	Sample Quantitation Verification

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory narrative noted that all samples were prepared using 500 milliliter sample aliquots rather than 1.00 liter sample aliquots.

The minimal detectable concentrations (MDCs) are elevated for samples DUP-01 Tot, A04BMW605D0003 Tot, A04BMW260003 Tot, DUP-01 Diss and A04BMW605D0003 Diss. As noted in the narrative "The associated Uranium samples did not meet the client requested reporting limit due to the presence of the nuclide in the sample and reduced sample volume."

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 05/03/2012 and 05/04/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 2130026 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Tota Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2E090000-26B	-0.0019 U	0.0039	0.035	-0.9991
U-235	F2E090000-26B	-0.0048 U	0.0069	0.051	-1.4117
U-238	F2E090000-26B	0.021 U	0.027	0.035	1.586

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 2130027 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2E090000-27B	0.015 U	0.029	0.052	1.0670
U-235	F2E090000-27B	-0.0064 U	0.0074	0.050	-1.7275
U-238	F2E090000-27B	0.007 U	0.020	0.044	0.6664

MDA- Minimal Detectable Activity

All method blank results are reported as non-detected (U).

No results are qualified based upon method blank results.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2130026 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 93.6% and 101.8% respectively. U-235 is not a spiked isotope.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2130027 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 101.2% and 103.2% respectively. U-235 is not a spiked isotope.

All LCS recoveries are within the QAPP acceptance criteria.

Matrix Spike Sample Results

The laboratory analyzed samples A04DMW604D0003 Tot (F2E080406-010) and A04DMW604D0003 Diss (F2E080406-021) as matrix spike/matrix spike duplicate pairs. U-235 is not a spiked isotope. All MS/MSD recoveries are within the laboratory derived recovery acceptance criteria. The U-234 laboratory derived acceptance criteria are 65-146% and the U-238 laboratory acceptance criteria are 68-143%.

A04DMW604D0003 Tot		
Radionuclide	**MS % Rec**	**MSD % Rec**
U-234	100%	131%
U-238	91%	121%

A04DMW604D0003 Diss		
Radionuclide	**MS % Rec**	**MSD % Rec**
U-234	100%	76%
U-238	96%	97%

No results are qualified based upon MS/MSD recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples DUP-01 Tot and A04BMW605D0003 Tot are a field duplicate pair. Results are summarized below.

Analyte	**DUP-01 Tot**			**A04BMW605D0003 Tot**		
	Result pCi/L	**TPU**	**MDA**	**Result pCi/L**	**TPU**	**MDA**
U-234	87.9	8.0	0.2	86.2	7.9	0.2
U-235	4.51	0.88	0.1	4.09	0.84	0.19
U-238	89.5	8.2	0.2	87.8	8.0	0.2

TPU – Total Propagated Uncertainty

Samples DUP-01 Diss and A04BMW605D0003 Diss are a field duplicate pair. Results are summarized below.

Analyte	DUP-01 Diss			A04BMW605D0003 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	80.6	7.3	0.2	90.2	8.3	0.2
U-235	3.63	0.73	0.14	4.37	0.89	0.10
U-238	77.9	7.1	0.07	89.6	8.2	0.2

TPU – Total Propagated Uncertainty

No results are qualified based upon the field duplicate results. All relative percent differences (RPDs) are less than 50%.

Laboratory Duplicates

The matrix spike/matrix spike duplicate results (MS/MSD) were analyzed as the laboratory duplicate pair. The relative percent differences are calculated from sample concentrations.

The laboratory analyzed sample A04DMW604D0003 Tot (F2E080406-10) as the laboratory MS/MSD pair for analytical batch 2130026.

Analyte	A04DMW604D0003 Tot MS			A04DMW604D0003 Tot MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	37.8	3.59	0.086	35.7	3.39	0.11
U-235	1.92	0.46	0.11	1.76	0.42	0.058
U-238	37.0	3.53	0.11	34.8	3.32	0.10

TPU – Total Propagated Uncertainty

No results are qualified based upon the MS/MSD duplicate precision. The relative percent differences (RPDs) are less than 40%.

The laboratory analyzed sample A04DMW604D0003 Tot (F2E080406-021) as the laboratory MS/MSD pair for analytical batch 2130027.

Analyte	A04DMW604D0003 Diss MSD			A04DMW604D0003 Diss MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	36.0	3.44	0.15	37.6	3.60	0.16
U-235	1.54	0.40	0.11	2.38	0.53	0.13
U-238	36.5	3.48	0.051	36.4	3.50	0.15

TPU – Total Propagated Uncertainty

No results are qualified based upon the MS/MSD duplicate precision. The RPDs are less than 40%.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04DMW713D0003 Tot (F2E080406-003) Batch 2130026

U-232 Tracer concentration: 71.00 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.100 DPM
U-232 Tracer Gross Counts: 395
U-232 Tracer Background Counts: 0.50
U-232 Tracer net counts: 394.5
Count Time: 240 minutes
Detector Efficiency: 28.22%

U-232 Tracer recovered = (394.50)/(240)(0.2822) = 5.824 DPM
U-232 Tracer % Recovery = (5.824 DPM/7.100 DPM) * 100 = 82.03%. The laboratory reported 82.02%.

The U-234 concentration for A04DMW713D0003 Tot (F2E080406-003) Batch 2130026

U-234 gross counts: 5.00

U-234 background counts: 0.0000
U-234 net counts: 5.00
Count time: 240 minutes
Detector Efficiency: 28.22%
Tracer Recovery: 82.02%
Sample volume: 0.5002 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (5.00)/(2.22)(0.5002)(240)(0.2822)(0.8202) = 0.081 pCi/L. The laboratory reported 0.081 pCi/L.

The U-232 tracer recovery for A04DMW604D0003 Tot (F2E080406-010) Batch 2130026

U-232 Tracer concentration: 71.00 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.100 DPM
U-232 Tracer Gross Counts: 343
U-232 Tracer Background Counts: 0.750
U-232 Tracer net counts: 342.25
Count Time: 240 minutes
Detector Efficiency: 26.63%

U-232 Tracer recovered = (342.25)/(240)(0.2663) = 5.355 DPM
U-232 Tracer % Recovery = (5.355 DPM/7.100 DPM) * 100 = 75.42%. The laboratory reported 75.38%.

The U-238 concentration for A04DMW604D0003 Tot (F2E080406-010) Batch 2130026

U-238 gross counts: 1543
U-238 background counts: 1.500
U-238 net counts: 1541.50
Count time: 240 minutes
Detector Efficiency: 26.63%
Tracer Recovery: 75.42%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (1541.5)/(2.22)(0.5004)(240)(0.2663)(0.7542) = 28.78 pCi/L. The laboratory reported 28.80 pCi/L.

The U-232 tracer recovery for A04BMW260003 Diss (F2E080406-020) Batch 2130027

U-232 Tracer concentration: 71.00 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.100 DPM
U-232 Tracer Gross Counts: 279
U-232 Tracer Background Counts: 5.750

U-232 Tracer net counts: 273.25
Count Time: 240 minutes
Detector Efficiency: 26.19%

U-232 Tracer recovered = (273.25)/(240)(0.2619) = 4.347 DPM
U-232 Tracer % Recovery = (4.347 DPM/7.100 DPM) * 100 = 61.23%. The laboratory reported 61.21%.

The U-238 concentration for A04BMW260003 Diss (F2E080406-020) Batch 2130027

U-238 gross counts: 2379
U-238 background counts: 0.250
U-238 net counts: 2378.75
Count time: 240 minutes
Detector Efficiency: 26.19%
Tracer Recovery: 61.22%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (2378.75)/(2.22)(0.5004)(240)(0.2619)(0.6122) = 55.65 pCi/L. The laboratory reported 55.67 pCi/L.

U-238 matrix spike recovery for A04DMW604D0003 Tot:
A04DMW604D0003 Tot U-238 concentration 28.8 pCi/L
A04DMW604D0003 Tot U-238 matrix spike concentration 37.02 pCi/L
U-238 spike concentration 6.7756 pCi/L
(37.02 pCi/L-28.8 pCi/L)/(6.7756 pCi/L) X 100 = 121.3%. The laboratory reported 121.2%.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of*

Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45 and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration

X		Sample Quantitation Verification

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

Non-detected results are reported as non-detected (U) at the reporting limit (RL). The RL is adjusted for sample volume and sample dilution.

The uranium result for A04DMW713D0003 Tot is qualified as estimated (J). The reported result is between the method detection limit (MDL) and 2X the MDL.

All total and dissolved results agree within 20%.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples. Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 05/03/2012 and 05/04/2012. The condition upon receipt form indicates that aqueous metal samples were properly preserved. The pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recovery is 93.4%

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL), 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW604D0003 Tot was analyzed as a MS/MSD pair associated with preparation batch 2131079. The MS/MSD recoveries are 96.4% and 96.8% respectively.

Sample A04DMW604D0003 Diss was analyzed as a MS/MSD pair associated with preparation batch 2131080. The MS/MSD recoveries are 93.9% and 97.5% respectively.

All MS/MSD recoveries are within the 70-130% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 20%.

Sample A04DMW604D0003 Tot was analyzed as a MS/MSD pair associated with preparation batch 2131079. The MS/MSD RPD is 0.4%.

Sample A04DMW604D0003 Diss was analyzed as a MS/MSD pair associated with preparation batch 2131080. The MS/MSD RPD is 3.5%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are $\leq$ 50% relative percent difference (RPD) for field duplicate samples.

Samples A04BMW605D0003/DUP-01 total and dissolved fractions are two field duplicate pairs. The field duplicate RPDs are less than 50%. The RPDs are 0.4% and 2.3% respectively.

No results are qualified based upon the field duplicate results.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 85-115%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. The IDL is 0.23 ug/L. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW604D0003 Tot was analyzed as the ICP-MS serial dilution sample with batch 2131079. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

Sample A04DMW604D0003 Diss was analyzed as the ICP-MS serial dilution sample with batch 2131080. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon the serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125% and the laboratory acceptance criteria of 80-120%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the RL. The RL is adjusted for sample volume and sample dilution.

All total and dissolved results agree within 20%.

The uranium result for A04DMW713D0003 Total is qualified as estimated (J). The reported result is between the MDL and 2X the MDL.

Calculations

Sample A04DMW604D0003 Tot, reported in laboratory data package F2E080406, was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 86.5 ug/L
MS uranium concentration: 1050 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1050 ug/L – 86.5 ug/L)/ 1000 ug/L)) * 100 = 96.4%. The laboratory reported 96.4%.

Serial Dilution:
Sample uranium concentration: 86.5 ug/L
Serial dilution concentration of the 5X dilution: 79.1 ug/L
ICP-MS Serial Dilution Percent Difference = ((86.5-79.1)/(86.5) * 100 = 8.55%. The laboratory reported 8.55%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic*

Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240). The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

The laboratory narrative noted that all samples were prepared using 500 milliliter sample aliquots except for sample A04BMW704DD0004. The sample volume for A04BMW704DD0004 is 100 milliliters because of high total solids. The minimal detectable concentration (MDC) for A04BMW704DD0004 is elevated.

Samples F2H090401-003-007, 007MS, 007MSD, 010, 011, 015, 016, 018MS, 018MSD and 020-022 were analyzed using 400 minute count times. All other samples were analyzed using 240 minute count times.

All isotopic uranium results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were not recorded for all field samples. The sampling time for A04DMW604D0004 is not reported on the COC.

Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

The laboratory reported the sample ID for laboratory ID F2H090401-007 as A04DMW604DD004 Tot and F2H090401-018 as A04DMW604D0004 Diss. The field ID as reported on the COC is A04DMW604D004. The laboratory narrative noted that the ID on the sample bottles was A04DMW604D0004. The field samplers confirmed that the correct ID is A04DMW604D0004. The data validation memo uses A04DMW604D0004. The sample ID was corrected on the EDD.

The field samplers confirmed that 3 other sample IDs on the COC are incorrect. The incorrect IDs are A04DMW709DD004, A04DMW710D004 and A04DMW710DD004. The correct IDs are A04DMW709DD0004, A04DMW710D0004 and A04DMW710DD0004. The data validation memo used the correct IDs. The sample IDs were corrected on the EDD. These corrections apply to the total and dissolved fractions.

Sample Preservation and Holding Times

Samples were collected on 08/03/2012 and 08/06/2012. The condition upon receipt form indicates that the aqueous metal samples for were not properly preserved. Sample A04BMW704DD0004 had a pH of 7 at sample receipt. The laboratory adjusted the pH to < 2 with nitric acid and allowed the sample to equilibrate for 24 hours prior to sample preparation. All other sample pHs were < 2.

The analytical holding time for the isotopic analyses was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 2226014 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2H130000-014B	0.013 U	0.022	0.035	1.217
U-235	F2H130000-014B	-0.0024 U	0.0048	0.043	-0.999
U-238	F2H130000-014B	0.0 U	0.0038	0.021	0.000

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 2226015 are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2H130000-015B	0.006 U	0.016	0.035	0.727
U-235	F2H130000-015B	-0.0 U	0.0048	0.026	0.000
U-238	F2H130000-015B	0.006 U	0.016	0.035	0.727

MDA- Minimal Detectable Activity

All method blank results are reported as non-detected (U).

No results are qualified based upon method blank results.

No equipment field blank samples were submitted.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2226014 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 109.8% and 99.7% respectively. U-235 is not a spiked isotope.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2226015 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100.6% and 98.5% respectively. U-235 is not a spiked isotope.

All LCS recoveries are within the QAPP acceptance criteria.

Matrix Spike Sample Results

The laboratory analyzed samples A04DMW604D0004 Tot (F2H090401-007) and A04DMW604D0004 Diss (F2H090401-018) as matrix spike/matrix spike duplicate pairs. U-235 is not a spiked isotope. All MS/MSD recoveries are not within the laboratory derived recovery acceptance criteria. The U-234 laboratory derived acceptance criteria are 65-146% and the U-238 laboratory acceptance criteria are 68-143%.

A04DMW604D0004 Tot		
Radionuclide	MS % Rec	MSD % Rec
U-234	50%	135%
U-238	51%	118%

A04DMW604D0004 Diss		
Radionuclide	MS % Rec	MSD % Rec
U-234	90%	71%
U-238	109%	88%

The MS recoveries for U-234 and U-238 for sample A04DMW604D0004 Tot are below the laboratory derived acceptance criteria. The MSD recoveries for A04DMW604D0004 Tot are within the laboratory derived acceptance criteria. The MS and MSD U-232 tracer recoveries are acceptable. The laboratory noted that the native sample concentration is greater than 4X the U-234 and U-238 spike concentrations. All MS/MSD RPDs are less than 20%.
No results are qualified based upon MS/MSD recoveries.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples DUPLICATE 02 Tot (F2H090401-011) and A04BMW605D0004 Tot (F2H090401-04) are a field duplicate pair. Results are summarized below.

Analyte	DUPLICATE 02 Tot			A04BMW605D0004 Tot		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	80.5	7.1	0.1	85.8	7.6	0.1
U-235	3.88	0.65	0.06	3.75	0.66	0.06
U-238	78.7	7.0	0.09	82.6	7.3	0.05

TPU – Total Propagated Uncertainty

Samples DUPLICATE 02 Diss (F2H090401-022) and A04BMW605D0004 Diss (F2H090401-015) are a field duplicate pair. Results are summarized below.

Analyte	DUPLICATE 02 Diss			A04BMW605D0004 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	91.3	8.1	0.1	78.7	7.0	0.1
U-235	4.58	0.77	0.12	3.67	0.63	0.10
U-238	89.8	8.0	0.1	77.5	6.9	0.1

TPU – Total Propagated Uncertainty

No results are qualified based upon the field duplicate results. All relative percent differences (RPDs) are less than 50%.

Laboratory Duplicates

The matrix spike/matrix spike duplicate results (MS/MSD) were analyzed as the laboratory duplicate pair. The relative percent differences are calculated from sample concentrations.

The laboratory analyzed sample A04DMW604D0004 Tot (F2H090401-007) as the laboratory MS/MSD pair for analytical batch 2226014.

Analyte	A04DMW604D0004 Tot MS			A04DMW604D0004 Tot MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	43.9	3.98	0.034	38.4	3.49	0.098
U-235	2.06	0.401	0.082	1.69	0.35	0.091
U-238	43.2	3.92	0.090	38.7	3.52	0.115

TPU – Total Propagated Uncertainty
No results are qualified based upon the MS/MSD duplicate precision. The relative percent differences (RPDs) are less than 40%.

The laboratory analyzed sample A04DMW604D0004 Diss (F2H090401-018) as the laboratory MS/MSD pair for analytical batch 2226015.

Analyte	A04DMW604D0004 Diss MS			A04DMW604D0004 Diss MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	39.1	3.55	0.031	40.4	3.66	0.074
U-235	2.06	0.38	0.039	2.2	0.38	0.040
U-238	39.4	3.57	0.089	40.8	3.70	0.032

TPU – Total Propagated Uncertainty

No results are qualified based upon the MS/MSD duplicate precision. The RPDs are less than 40%.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04DMW713D0004 Tot (F2H090401-001) Batch 2226014

U-232 Tracer concentration: 70.87 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.09 DPM
U-232 Tracer Gross Counts: 380
U-232 Tracer Background Counts: 1.50
U-232 Tracer net counts: 378.5
Count Time: 240 minutes
Detector Efficiency: 26.99%

U-232 Tracer recovered = (378.50)/(240)(0.2699) = 5.843 DPM
U-232 Tracer % Recovery = (5.843 DPM/7.09 DPM) * 100 = 82.41%. The laboratory reported 82.46%.

The U-234 concentration for A04DMW713D0004 Tot (F2H090401-001) Batch 2226014

U-234 gross counts: 8.00
U-234 background counts: 0.5000
U-234 net counts: 7.5000
Count time: 240 minutes
Detector Efficiency: 26.99%
Tracer Recovery: 82.41%
Sample volume: 0.5001 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (7.500)/(2.22)(0.5001)(240)(0.2699)(0.8241) = 0.1263 pCi/L. The laboratory reported 0.1267 pCi/L.

The U-232 tracer recovery for DUPLICATE 02 Tot (F2H090401-011) Batch 2226014

U-232 Tracer concentration: 70.87 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.09 DPM
U-232 Tracer Gross Counts: 394
U-232 Tracer Background Counts: 2.917
U-232 Tracer net counts: 391.08
Count Time: 400 minutes
Detector Efficiency: 27.07%

U-232 Tracer recovered = (391.08)/(400)(0.2707) = 3.611 DPM
U-232 Tracer % Recovery = (3.611 DPM/7.09 DPM) * 100 = 50.94%. The laboratory reported 50.97%.

The U-238 concentration for DUPLICATE 02 Tot (F2H090401-011) Batch 2226014

U-238 gross counts: 4823
U-238 background counts: 0.4167

U-238 net counts: 4822.58
Count time: 400 minutes
Detector Efficiency: 27.07%
Tracer Recovery: 50.94%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (4822.58)/(2.22)(0.5004)(400)(0.2707)(0.5094) = 78.70 pCi/L. The laboratory reported 78.66 pCi/L.

The U-232 tracer recovery for A04DMW604D0004 Diss (F2H090401-018) Batch 2226015

U-232 Tracer concentration: 70.87 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.09 DPM
U-232 Tracer Gross Counts: 349
U-232 Tracer Background Counts: 1.000
U-232 Tracer net counts: 348
Count Time: 240 minutes
Detector Efficiency: 27.32%

U-232 Tracer recovered = (348)/(240)(0.2732) = 5.307 DPM
U-232 Tracer % Recovery = (5.307 DPM/7.09 DPM) * 100 = 74.85%. The laboratory reported 74.90%.

The U-238 concentration for A04DMW604D0004 Diss (F2H090401-018) Batch 2226015

U-238 gross counts: 1826
U-238 background counts: 0.500
U-238 net counts: 1825.5
Count time: 240 minutes
Detector Efficiency: 27.32%
Tracer Recovery: 74.90%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (1826.5)/(2.22)(0.5004)(240)(0.2732)(0.7485) = 33.50 pCi/L. The laboratory reported 33.46 pCi/L.

U-238 matrix spike recovery for A04DMW604D0004 Tot (F2H090401-007):
A04DMW604D0004 Tot (F2H090401-007) U-238 concentration 35.2 pCi/L
A04DMW604D0004 Tot (F2H090401-007S) U-238 matrix spike concentration 43.20 pCi/L
U-238 spike concentration 6.7756 pCi/L
(43.2 pCi/L-35.2 pCi/L)/(6.7756 pCi/L) X 100 = 118.1%. The laboratory reported 118.3%.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FD- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

All results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were not recorded for all field samples. The sampling time for A04DMW604D0004 is not reported on the COC.

Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

The laboratory reported the sample ID for laboratory ID F2H090401-007 as A04DMW604DD004 Tot and F2H090401-018 as A04DMW604D0004 Diss. The field ID as reported on the COC is A04DMW604D004. The laboratory narrative noted that the ID on the sample bottles was A04DMW604D0004. The field samplers confirmed that the correct ID is A04DMW604D0004. The data validation memo uses A04DMW604D0004. The sample ID was corrected on the EDD.

The COC noted that the laboratory did not receive a sample bottle for A04BMW707DD0004 total uranium. The client used an aliquot from the total isotopic uranium sample.

The field samplers confirmed that 3 other sample IDs on the COC were incorrect. The incorrect IDs are A04DMW709DD004, A04DMW710D004 and A04DMW710DD004. The correct IDs are A04DMW709DD0004, A04DMW710D0004 and A04DMW710DD0004. The data validation memo used the correct IDs. The sample IDs were corrected on the EDD. These corrections apply to both the total and dissolved fractions.

Sample Preservation and Holding Times

Samples were collected on 08/03/2012 and 08/06/2012. The condition upon receipt form indicates that the aqueous metal samples for were not properly preserved. Sample A04BMW704DD004 had a pH of 7 at sample receipt. The laboratory adjusted the pH to < 2 with nitric acid and allowed the sample to equilibrate for 24 hours prior to sample preparation. All other sample pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. The analytical holding time was met. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recoveries were 100% and 96%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL), 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW604D0004 Tot was analyzed as a MS/MSD pair associated with preparation batch 2223062. The MS/MSD recoveries are 97.6% and 99.3% respectively.

Sample A04DMW604D0004 Diss was analyzed as a MS/MSD pair associated with preparation batch 2223063. The MS/MSD recoveries are 97.0% and 96.8% respectively.

All MS/MSD recoveries are within the 70-130% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to

determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is ≤ 20%.

Sample A04DMW604D0004 Tot was analyzed as a MS/MSD pair associated with preparation batch 2223062. The MS/MSD RPD is 1.6%.

Sample A04DMW604D0004 Diss was analyzed as a MS/MSD pair associated with preparation batch 2223063. The MS/MSD RPD is 0.2%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples A04BMW605D0004 and DUPLICATE 02, total and dissolved fractions, are two field duplicate pairs. The field duplicate RPDs are less than 50%. The RPDs are 1.9% and 0.0% respectively.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 85-115%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. The IDL is 0.23 ug/L. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW604D0004 Tot was analyzed as the ICP-MS serial dilution sample with batch 2223062. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

Sample A04DMW604D0004 Diss was analyzed as the ICP-MS serial dilution sample with batch 2223063. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon the serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the RL. The RL is adjusted for sample volume and sample dilution.

In those circumstances where dissolved results are greater than total results no total and dissolved results differ by more than 20%.

Calculations

Sample A04DMW604D0004 Tot (F2H090401-007), reported in laboratory data package F2H090401 (batch 2223062), was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 108 ug/L
MS uranium concentration: 1083 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1083 ug/L – 108 ug/L)/ 1000 ug/L)) * 100 = 97.5%. The laboratory reported 97.6%.

Serial Dilution:

Sample uranium concentration: 108 ug/L
Serial dilution concentration of the 5X dilution: (20.74 ug/L * 5) = 103.7 ug/L
ICP-MS Serial Dilution Percent Difference = ((108-103.7)/(108)) * 100 = 3.98%. The laboratory reported 3.94%.

Sample A04DMW604D0004 Diss (F2H090401-018), reported in laboratory data package F2H090401 (batch 2223063), was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Duplicate Recovery:
Sample uranium concentration: 105 ug/L
MS uranium concentration: 1073 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1073 ug/L – 105 ug/L)/ 1000 ug/L)) * 100 = 96.8%. The laboratory reported 96.8%.

Serial Dilution:

Sample uranium concentration: 105.1 ug/L
Serial dilution concentration of the 5X dilution: (21.36 ug/L * 5) = 106.8 ug/L
ICP-MS Serial Dilution Percent Difference = ((105.1-106.8)/(105.1)) * 100 = 1.7%. The laboratory reported 1.6%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FDUP- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the isotopic uranium analytical data from total and dissolved samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with Department of Energy (DOE) Health and Safety Laboratories-300 (HASL) Alpha Spectroscopy according to laboratory standard operating procedure (SOP) *Isotopic*

Uranium, Americium, Curium, Plutonium, Thorium and Uranium in Various Matrices by EIChroM ® Separation Resins (STL-RC-240). The target radionuclides are U-234, U-235 and U-238. The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007*, the *Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) 2004* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	Initial Calibrations
	X	Initial Calibration Verifications
	X	Daily Pulser Checks
	X	Blank Results
	X	Sample Specific Tracer Recoveries
	X	Laboratory Control Samples

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the total and dissolved isotopic uranium analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site. Dissolved samples were field filtered.

All samples were prepared using 500 milliliter sample aliquots.

Sample A04DMW713D0005 Tot was analyzed using an 800 minute count time. All other total sample aliquots were analyzed using 400 minute counts. All dissolved sample aliquots were analyzed using 600 minute count times.

The laboratory narrative noted that the contract required detection limits for A04BMW605D0005 Tot, A04BMW260005 Tot and A04BMW605D0005 Diss were not met. These samples had high activities above the minimal detectable concentration (MDC).

All isotopic uranium results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples except the blind field duplicate samples; DUPLICATE 03 Total and Dissolved fractions.

Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 10/22/2012, 10/23/2012 and 10/24/2012. The condition upon receipt form indicates that the aqueous metal samples for were not properly preserved. Sample A04DMW713D0005 Tot had a pH of 7 at sample receipt. The laboratory adjusted the pH to < 2 with nitric acid and allowed the sample to equilibrate for 24 hours prior to sample preparation. All other sample pHs were < 2.

The analytical holding time for the isotopic analyses was met.

No results are qualified based upon sample preservation and analytical holding times.

Initial Calibration Results

All criteria were met.

Alpha Spectroscopy Background

All criteria were met.

Daily Pulser Checks

All criteria were met.

Laboratory and Field Blank Analyses

Aqueous method blank results associated with preparation batch 2300025 total are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2J260000-025B	0.0024	0.0089	0.022	0.5383
U-235	F2J260000-025B	0.010	0.015	0.014	1.4117
U-238	F2J260000-025B	0.0066	0.012	0.022	1.0729

MDA- Minimal Detectable Activity

Aqueous method blank results associated with preparation batch 2306013 dissolved are summarized below.

Radionuclide	Sample ID	Conc pCi/L	Total Uncertainty pCi/L	MDA pCi/L	Z-Factor
U-234	F2K010000-013B	0.0066	0.017	0.032	0.7785
U-235	F2K010000-013B	-0.0032	0.011	0.031	-0.5935
U-238	F2K010000-013B	-0.020	0.021	0.050	-1.9441

MDA- Minimal Detectable Activity

All method blank results are reported as non-detected (U).

No results are qualified based upon method blank results.

No equipment field blank samples were submitted.

Sample Specific Chemical Tracer Recoveries

The laboratory did tabulate the radioisotope tracer recoveries on the report of analyses form 1s. The tracer acceptance range is 40%-110%. Results associated with tracer recoveries less than 40% and greater than 20% are qualified as estimated (J). Results associated with tracer recoveries less than 20% are qualified as rejected (R). Tracer recoveries that are not within the 40%-110% acceptance criteria are summarized below.

Sample ID	Tracer Recovery
None	

No results are qualified based upon tracer recoveries.

Laboratory Control Samples

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2300025 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 101.2% and 109.8% respectively. U-235 is not a spiked isotope.

LCS recoveries that exceed the laboratory derived acceptance criteria for preparation batch 2306013 are summarized below.

Radionuclide	STF ID	Lab ID	% Deviation Range	% Deviation
None				

The U-234 and U-238 LCS recoveries are 100.1% and 98.9% respectively. U-235 is not a spiked isotope.

All LCS recoveries are within the QAPP acceptance criteria. The laboratory derived acceptance criteria are 84-120% for U-234 and 83-121% for U-238.

Matrix Spike Sample Results

The laboratory analyzed samples A04DMW604D0005 Tot (F2J250431-006) and A04DMW604D0005 Diss (F2J250431-017) as matrix spike/matrix spike duplicate pairs. U-235 is not a spiked isotope. All MS/MSD recoveries are not within the laboratory derived recovery acceptance criteria. The U-234 laboratory derived acceptance criteria are 65-146% and the U-238 laboratory acceptance criteria are 68-143%.

A04DMW604D0005 Tot		
Radionuclide	**MS % Rec**	**MSD % Rec**
U-234	74.4%	79.3%
U-238	94.4%	101.1%

A04DMW604D0005 Diss		
Radionuclide	**MS % Rec**	**MSD % Rec**
U-234	150.4%	144.4%
U-238	120.9%	152.6%

The MS recovery for U-234 for sample A04DMW604D0005 Diss is above the laboratory derived acceptance criteria. The MSD recovery for U-238 for sample A04DMW604D0005 Diss is above the laboratory derived acceptance criteria. The MS and MSD U-232 tracer recoveries are acceptable. The laboratory noted that the native sample concentration is greater than 4X the U-234 and U-238 spike concentrations.

Using professional judgment no results are qualified based upon MS/MSD recoveries. Trace recoveries were within the acceptance criteria and the MS/MSD results for the total fractions are within the method acceptance criteria.

The laboratory re-extracted and re-analyzed the sample batch associated the high MS/MSDs. All results are reported from the re-extraction re-analyses.

All MS/MSD RPDs are less than 20%.

Field Replicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples DUPLICATE 03 Tot (F2J250431-007) and A04DMW604D0005 Tot (F2J250431-006) are a field duplicate pair. Results are summarized below.

Analyte	DUPLICATE 03 Tot			A04DMW604D0005 Tot		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	33.6	3.1	0.092	36.1	3.3	0.077
U-235	2.1	0.38	0.086	1.65	0.35	0.042
U-238	34.5	3.2	0.078	35.4	3.3	0.065

TPU – Total Propagated Uncertainty

Samples DUPLICATE 03 Diss (F2J250431-018) and A04DMW604D0005 Diss (F2J250431-017) are a field duplicate pair. Results are summarized below.

Analyte	DUPLICATE 03 Diss			A04DMW604D0005 Diss		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	34.6	3.1	0.058	32.2	2.9	0.059
U-235	1.8	0.29	0.023	1.7	0.28	0.064
U-238	34.3	3.0	0.050	32.6	2.9	0.058

TPU – Total Propagated Uncertainty

No results are qualified based upon the field duplicate results. All relative percent differences (RPDs) are less than 50%.

Laboratory Duplicates

The matrix spike/matrix spike duplicate results (MS/MSD) were analyzed as the laboratory duplicate pair. The relative percent differences are calculated from sample concentrations.

The laboratory analyzed sample A04DMW604D0005 Tot (F2J250431-006) as the laboratory MS/MSD pair for analytical batch 2300025.

Analyte	A04DMW604D0005 Tot MS			A04DMW604D0005 Tot MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	41.0	3.73	0.099	41.3	3.76	0.097
U-235	2.11	0.41	0.083	2.46	0.44	0.098
U-238	41.8	3.80	0.098	42.3	3.84	0.129

TPU – Total Propagated Uncertainty

No results are qualified based upon the MS/MSD duplicate precision. The relative percent differences (RPDs) are less than 40%.

The laboratory analyzed sample A04DMW604D0005 Diss (F2J250431-017) as the laboratory MS/MSD pair for analytical batch 2306013.

Analyte	A04DMW604D0005 Diss MS			A04DMW604D0005Diss MSD		
	Result pCi/L	TPU	MDA	Result pCi/L	TPU	MDA
U-234	42.0	3.72	0.022	41.6	3.69	0.062
U-235	2.11	0.34	0.028	1.97	0.33	0.028
U-238	40.8	3.62	0.061	43.0	3.80	0.022

TPU – Total Propagated Uncertainty

No results are qualified based upon the MS/MSD duplicate precision. The RPDs are less than 40%.

Radionuclide Quantitation and Implied Detection Limits

The laboratory reported the results with analytical uncertainties.

Some results are reported as negative results. Based upon *US Army Corp Guidance "USACE, RADIONUCLIDE DATA QUALITY EVALUATION GUIDANCE, May 2009"* "Negative results that have uncertainties greater than the absolute value of the result, qualify the result "U" and "for negative results that have uncertainties smaller than their absolute value, qualify the data "R" as rejected." These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

All reported negative results are qualified as non-detected (U) or non-detected estimated (UJ). No negative results are qualified based upon the analytical uncertainties.

If a result is greater than its MDA, but less than its uncertainty, the probability that the result is greater than the MDA is greater than the probability that the result is less than the MDA. These results are qualified as estimated (J). These results are summarized below.

Sample ID	Radionuclide	Result pCi/L	2 Sigma	MDA
None				

Spectrometry Resolution

Alpha spectra for all field samples and QC samples were reviewed. Peaks for the field samples are properly identified, well defined and adequately resolved.

No results are qualified due to spectral resolution.

Calculations

The U-232 tracer recovery for A04DMW708DD0005 Tot (F2J250431-003) Batch 2300025

U-232 Tracer concentration: 70.78 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.08 DPM
U-232 Tracer Gross Counts: 628
U-232 Tracer Background Counts: 0.4167
U-232 Tracer net counts: 627.5
Count Time: 400 minutes
Detector Efficiency: 27.73%

U-232 Tracer recovered = (627.50)/(400)(0.2773) = 5.657 DPM
U-232 Tracer % Recovery = (5.657 DPM/7.08 DPM) * 100 = 79.90%. The laboratory reported 80.00%.

The U-234 concentration for A04DMW708DD0005 Tot (F2J250431-003) Batch 2300025

U-234 gross counts: 651
U-234 background counts: 2.9167
U-234 net counts: 648
Count time: 400 minutes
Detector Efficiency: 27.73%
Tracer Recovery: 80.00%
Sample volume: 0.5003 Liter
1 picocurie = 2.22 counts/minute

U-234 Concentration: = (648)/(2.22)(0.5003)(400)(0.2773)(0.8000) = 6.58 pCi/L. The laboratory reported 6.59 pCi/L.

The U-232 tracer recovery for DUPLICATE 02 Tot (F2H090401-011) Batch 2226014

U-232 Tracer concentration: 70.87 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.09 DPM
U-232 Tracer Gross Counts: 394
U-232 Tracer Background Counts: 2.917
U-232 Tracer net counts: 391.08
Count Time: 400 minutes
Detector Efficiency: 27.07%

U-232 Tracer recovered = (391.08)/(400)(0.2707) = 3.611 DPM
U-232 Tracer % Recovery = (3.611 DPM/7.09 DPM) * 100 = 50.94%. The laboratory reported 50.97%.

The U-238 concentration for DUPLICATE 02 Tot (F2H090401-011) Batch 2226014

U-238 gross counts: 4823
U-238 background counts: 0.4167

U-238 net counts: 4822.58
Count time: 400 minutes
Detector Efficiency: 27.07%
Tracer Recovery: 50.94%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (4822.58)/(2.22)(0.5004)(400)(0.2707)(0.5094) = 78.70 pCi/L. The laboratory reported 78.66 pCi/L.

The U-232 tracer recovery for A04DMW708DD0005 Diss (F2J250431-014) Batch 2306013

U-232 Tracer concentration: 70.78 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.08 DPM
U-232 Tracer Gross Counts: 989
U-232 Tracer Background Counts: 8.125
U-232 Tracer net counts: 980.9
Count Time: 600 minutes
Detector Efficiency: 28.58%

U-232 Tracer recovered = (980.9)/(600)(0.2858) = 5.720 DPM
U-232 Tracer % Recovery = (5.720 DPM/7.08 DPM) * 100 = 80.79%. The laboratory reported 80.90%.

The U-238 concentration for A04DMW708DD0005 Diss (F2J250431-014) Batch 2306013

U-238 gross counts: 991
U-238 background counts: 3.750
U-238 net counts: 987.25
Count time: 600 minutes
Detector Efficiency: 28.58%
Tracer Recovery: 80.90%
Sample volume: 0.5002 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (987.25)/(2.22)(0.5002)(600)(0.2858)(0.8090) = 6.41 pCi/L. The laboratory reported 6.41 pCi/L.

The U-232 tracer recovery for A04DMW604D0005 Diss (F2J250431-017S) Batch 2306013

U-232 Tracer concentration: 70.78 DPM/mL (DPM = disintegrations/minute)
U-232 Tracer volume: 0.10 mL
U-232 Tracer added: 7.08 DPM
U-232 Tracer Gross Counts: 766
U-232 Tracer Background Counts: 0.000
U-232 Tracer net counts: 766

Count Time: 600 minutes
Detector Efficiency: 27.69%

U-232 Tracer recovered = (766)/(600)(0.2769) = 4.610 DPM
U-232 Tracer % Recovery = (4.610 DPM/7.08 DPM) * 100 = 65.11%. The laboratory reported 65.20%.

The U-238 concentration for A04DMW604D0005 Diss (F2J250431-017S) Batch 2306013

U-238 gross counts: 4913
U-238 background counts: 1.25
U-238 net counts: 4911.75
Count time: 600 minutes
Detector Efficiency: 27.69%
Tracer Recovery: 65.20%
Sample volume: 0.5004 Liter
1 picocurie = 2.22 counts/minute

U-238 Concentration: = (4911.75)/(2.22)(0.5004)(600)(0.2769)(0.6520) = 40.81 pCi/L. The laboratory reported 40.81 pCi/L.

U-238 matrix spike recovery for A04DMW604D0005 Diss (F2J250431-017S):
A04DMW604D0005 Diss (F2J250431-017) U-238 concentration 32.6 pCi/L
A04DMW604D0005 Diss (F2J250431-017S) U-238 matrix spike concentration 40.8 pCi/L
U-238 spike concentration 6.7756 pCi/L
(40.8 pCi/L-32.6 pCi/L)/(6.7756 pCi/L) X 100 = 121.0%. The laboratory reported 120.9%.

Table 1 summarizes the evaluated aqueous sample results. Result tables are appended to this submittal. Qualifiers were entered onto the laboratory submitted EDD and the qualified data tables were submitted to Shaw Environmental and Infrastructure electronically.

Sincerely,

Kestrel Environmental Technologies, Inc.

Tot- Total Diss- Dissolved (field filtered) FDUP- Field Duplicate

Dear Mr. Van Keuren,

A data evaluation was performed on the total uranium analyses, both total and dissolved fractions, from samples collected by Shaw Environmental and Infrastructure at the Guterl Steel site.

The laboratory, Test America, Earth City, MO, reported that the samples were prepared in accordance with US EPA SW-846 Method 3010 Modified (acid digestion). Total and dissolved uranium results were determined in accordance with US EPA SW-846 Method 6020A; Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The dissolved samples were field filtered.

The data evaluation was conducted in accordance with the *Former Guterl Specialty Steel Corporation, Lockport, NY, Quality Assurance Project Plan (QAPP) June 2007, Validation of Metals for the Contract Laboratory Program (CLP) based on ILM05.3 SOP # HW-2, September 2006, US EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (OSWER 9240.1-45* and in conjunction with the individual method and the laboratory established criteria. The following items were evaluated:

All parameters require USEPA Region 2 data validation. The following items were evaluated:

Qualified		Parameters
Yes	**No**	
	X	Chain of Custody (COC) Documents
	X	Preservation and Technical Holding Time
	X	ICP-MS Tuning
	X	Initial Calibration
	X	Continuing Calibration
	X	Low Level Initial Calibration Verification (CRDL)
	X	Blank Analyses
	X	Interference Check Sample Results
	X	Matrix and Matrix Spike Duplicate Recoveries
	X	Laboratory Duplicate Precision
	X	Laboratory Control Samples (Blank Spike)
	X	Field Duplicate Precision
	X	ICP-MS Serial Dilutions
	X	ICP-MS Internal Standard Recoveries
	X	Sample Quantitation Verification

NA Not Applicable

Table 1 summarizes the recommendations that are based upon the following information:

Summary

A data evaluation was performed on the reported 6020 total and dissolved uranium elemental analytical data from samples collected by Shaw Environmental and Infrastructure at the Guterl Specialty Steel site.

All results are reported without qualification.

Chain of Custody Documents

The chain of custody (COC) was properly signed and dated. The sampling dates and sampling times were recorded for all field samples except the blind field duplicate samples; DUPLICATE 03 Total and Dissolved fractions.

Custody seals were present and intact on the sample coolers. Custody seals were not present on the sample containers.

Sample Preservation and Holding Times

Samples were collected on 10/22/2012, 10/23/2012 and 10/24/2012. The condition upon receipt form indicates that the aqueous metal samples for were not properly preserved. Sample A04DMW713D0005 Tot had a pH of 7 at sample receipt. The laboratory adjusted the pH to < 2 with nitric acid and allowed the sample to equilibrate for 24 hours prior to sample preparation. All other sample pHs were < 2.

The analytical holding time for ICP-MS analysis is 180 days. ICP-MS analyses were completed within the analytical holding time.

No results are qualified based upon sample preservation and analytical holding times.

ICP-MS Tuning

The tuning solution results were within the method acceptance criteria, resolution better than 0.1 atomic mass units (amu) for each tuning isotope and relative standard deviations less than 5.0%.

Initial Calibration Results

The laboratory did provide initial calibration verification (ICV) data for the ICP-MS analyses. All ICV results were between the 90-110% method acceptance criteria. No results are qualified based upon the initial calibration results.

Continuing Calibration Results

All ICP-MS bracketing continuing calibration results met the method acceptance criteria, 90-110%.

The laboratory analyzed an ICP-MS elements standard at or near 2 X the laboratory's reporting limit, 1.0 ug/L. The laboratory has labeled this standard as the CRDL (contract required detection limit standard) on the summary forms. The uranium CRDL standard concentration is 1.0 ug/L. The CRDL recoveries were 94.8% and 105.2%.

No results are qualified based upon CRDL standard recoveries.

Laboratory and Field Blank Analyses

Positive ICP-MS instrument blank results and positive preparation blank results are summarized below:

Analyte	Type of Blank	IDL	MDL	Blank Conc
None				

CCB – Continuing Calibration Blank MB – Prep Blank

All uranium method blank and instrument blank results are reported as non-detected (U) at the method detection limit (MDL), 0.23 ug/L.

All samples were collected from dedicated samplers. No field equipment blank samples were provided.

ICP-MS Interference Check Sample Results

ICP-MS interference check standards are analyzed to evaluate spectral background interferences and to evaluate potential interelement interferences.

All ICP-MS interference check sample acceptance criteria are 80-120% recoveries for the ICSA and ICSAB solutions.

ICSA and ICSAB solutions for ICP-MS analyses were analyzed at the beginning of the analytical sequence. Samples were analyzed immediately following the ICSA and ICSAB analyses. All ICSA and ICSAB recoveries were within the 80-120% acceptance criteria.

Matrix Spike Results

Matrix spike/matrix spike duplicate (MS/MSD) samples are analyzed to evaluate analytical precision and accuracy in the sample matrix.

Sample A04DMW604D0005 Tot was analyzed as a MS/MSD pair associated with preparation batch 2300080. The MS/MSD recoveries are 105.6% and 104.7% respectively.

Sample A04DMW604D0005 Diss was analyzed as a MS/MSD pair associated with preparation batch 2300077. The MS/MSD recoveries are 107.5% and 107.6% respectively.

All MS/MSD recoveries are within the 70-130% QAPP acceptance criteria.

No results are qualified based upon the MS/MSD results.

Laboratory Duplicates

The laboratory did not analyze a laboratory duplicate sample. The MS/MSD results are evaluated to determine analytical precision in the sample matrix.

The QAPP acceptance relative percent difference (RPD) for laboratory duplicate samples is $\leq$ 20%.

Sample A04DMW604D0005 Tot was analyzed as a MS/MSD pair associated with preparation batch 2300080. The MS/MSD RPD is 0.7%.

Sample A04DMW604D0005 Diss was analyzed as a MS/MSD pair associated with preparation batch 2300077. The MS/MSD RPD is 0.1%.

No results are qualified based upon laboratory duplicate precision.

Field Duplicates

Field duplicates are evaluated to determine precision of both the sampling and analytical procedures. The QAPP acceptance criteria for aqueous samples are ≤ 50% relative percent difference (RPD) for field duplicate samples.

Samples A04DMW604D0005 and DUPLICATE 03, total and dissolved fractions, are two field duplicate pairs. The field duplicate RPDs are less than 50%. The RPDs are 0.8% and 2.6% respectively.

LCS Results

LCS samples are analyzed to evaluate accuracy of the analytical method on a controlled matrix. The percent recoveries should be within the QAPP acceptance criteria.

The QAPP LCS recovery acceptance criterion for ICP-MS analyses is 85-115%.

LCS results that exceed the QAPP acceptance criteria are summarized below.

Elements	Spike Conc ug/L	Result ug/L	% Recovery	Action
None				

No results are qualified based upon the LCS results.

ICP-MS Serial Dilution Results

Serial dilutions are analyzed to determine potential matrix interferences in the sample. ICP-MS results that are greater than 50X the instrument detection limit (IDL) should have a % difference (%D) less than 10%. The IDL is 0.23 ug/L. If the %D exceeds 10% results are qualified as estimated (J).

Sample A04DMW604D0005 Tot was analyzed as the ICP-MS serial dilution sample with batch 2300080. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

Sample A04DMW604D0005 Diss was analyzed as the ICP-MS serial dilution sample with batch 2300077. ICP-MS serial dilution results that exceed 10% D are summarized below.

Elements	Sample Result ug/L	Serial Dil ug/L	% D	Action
None				

No results are qualified based upon the serial dilution results.

ICP-MS Internal Standard Recoveries

All internal standard recoveries were within the method acceptance criteria of 60-125%.

No results are qualified based upon ICP-MS internal standard recoveries.

Method Detection Limit Results/Practical Quantitation Limits

Non-detected results are reported as non-detected (U) at the RL. The RL is adjusted for sample volume and sample dilution.

In those circumstances where dissolved results are greater than total results no total and dissolved results differ by more than 20%.

Calculations

Sample A04DMW604D0005 Tot (F2J250431-006), reported in laboratory data package F2J250431 (batch 2300080), was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Recovery:
Sample uranium concentration: 112 ug/L
MS uranium concentration: 1170 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1170 ug/L – 112 ug/L)/ 1000 ug/L)) * 100 = 105.8%. The laboratory reported 105.6%.

Serial Dilution:
Sample uranium concentration: 112 ug/L
Serial dilution concentration of the 5X dilution: (21.0 ug/L * 5) = 105.0 ug/L
ICP-MS Serial Dilution Percent Difference = ((112-105.0)/(112)) * 100 = 6.25%. The laboratory reported 6.41%.

Sample A04DMW604D0005 Diss (F2J250431-017), reported in laboratory data package F2J250431 (batch 2300077), was analyzed as the batch matrix spike sample (MS) and as the serial dilution sample.

Matrix Spike Duplicate Recovery:
Sample uranium concentration: 111 ug/L
MS uranium concentration: 1190 ug/L
MS spike concentration: 1000 ug/L
MS % recovery = ((1190 ug/L – 111 ug/L)/ 1000 ug/L)) * 100 = 107.9%. The laboratory reported 107.5%.

Serial Dilution:
Sample uranium concentration: 111 ug/L
Serial dilution concentration of the 5X dilution: (20.4 ug/L * 5) = 102 ug/L
ICP-MS Serial Dilution Percent Difference = ((111-102)/(111)) * 100 = 8.1%. The laboratory reported 8.0%.

The laboratory included supporting documentation Method Detection Limits Form 10, Interelement Correction Factors Form 11, Linear Ranges Form 12, Sample Preparation Summary Form 13, Analysis Run Log Form 14, sample preparation log books and analytical sequence run logs.

Table 1 summarizes the qualified sample results.

Sincerely,

Kestrel Environmental Technologies, Inc.

APPENDIX F

Evaluation of High Frequency Monitoring Data

Appendix F
Evaluation of High Frequency Monitoring Data

Introduction

A series of supplemental sampling events were conducted between August 2011 and October 2012 to determine if there was seasonal variability in the uranium (U) concentrations observed in the groundwater at Guterl, and if seasonal variations were present could they be correlated to seasonal variations in the groundwater chemistry. To accomplish these goals, 10 wells were selected for quarterly sampling and for high-frequency monitoring of water levels with pressure transducers (In-Situ™ Troll Level Loggers) and other geochemical parameters with multi-parameter water quality transducers (In-Situ™ Troll 9500s). The wells that were included in these sampling events were shallow/deep well pairs MW-26/MW-707DD, MW-604D/ MW-709DD, MW-605D/MW-704DD, MW-710D/MW-710DD, and MW-713D/MW-708DD. This set included seven wells installed during the DGI field work (the 700-series wells) and three wells installed during previous investigations (MW-26, MW-604D, and MW-605D).

Uranium Concentrations

The total uranium (filtered) results from the DGI sampling event and the four quarterly sampling events are shown on Figure F-1. The uranium concentrations were generally highest in the samples from the three existing wells that were included in the quarterly sampling – MW-26, MW-604D, and MW-605D. These wells are aligned northwest to southeast, roughly along the center axis of the plume, which generally corresponds to the predominant regional fracture traces. The groundwater seeps with the highest uranium concentrations are located downgradient of the uranium groundwater plume axis defined by these wells. Based on the sampling results shown on Figure F-1, the total uranium concentrations appear to be fairly stable and there is not any apparent seasonal variation that is consistent between individual monitoring wells.

To evaluate the quarterly sampling results relative to previously collected groundwater data for the site, a plot of isotopic ^{238}U (filtered) was made that includes the quarterly sampling results and the previously collected results for wells MW-26, MW-604D, and MW-605D, and is shown on Figure F-2. This comparison was made using the isotopic ^{238}U data because total uranium data were not available from the two sampling events in 2007. The DGI and quarterly isotopic ^{238}U sample results fall within the range of concentrations previously detected for each well.

Groundwater Elevation

The quarterly groundwater elevation measurements are shown on Figure F-3. Figure F-4 shows the groundwater elevations recorded in the wells equipped with the Troll Level-Logger

transducers and Figure F-5 shows the correlation between the manual groundwater elevation measurements and the transducer data. The groundwater elevation in the quarterly wells is between 585 and 600 feet (MSL) in all the wells with the exception of MW-707DD and MW-710DD. There does not generally appear to be any significant seasonal variation in the groundwater elevations. The groundwater elevation in MW-707DD is consistently much lower than the groundwater elevation in MW-26, which is the shallow well immediately adjacent to it. The rock core from MW-707DD was observed to have very few fractures, the measured hydraulic conductivity was low, and the well is slow to recharge during sampling. It appears that the groundwater elevation in MW-707DD is more influenced by deeper fractures which appear to produce less water than the overlying shallow fractures. Similarly, there is a considerable difference in the groundwater elevations measured in well pair MW-710D and MW-710DD, indicating limited vertical hydraulic connection in that area. Well pair MW-604D and MW-709DD track fairly closely, with the groundwater elevation being only slightly lower in MW-709DD during each sampling event. The groundwater elevations in well pair MW-605D and MW-704DD are nearly identical, indicating good vertical connectivity in that area.

The sharp drops and slow increases in groundwater elevation at MW-707DD correspond to purging of the well during sampling events and are indicative of the slow recharge in that well. The sharp spikes noted in the other well records are the result of measurements that were recorded while the transducers were removed during sampling and maintenance. The sharp drop in groundwater elevation in the fall and sharp increase in the spring noted in MW-710DD corresponds to the timing of the seasonal lowering of the pool elevation in the Erie Canal. Well MW-710DD is located at the downgradient edge of the site and is upgradient of the main seep location noted in the canal. Figure F-5 indicates a good correlation between the manual groundwater elevation measurements and the transducer data. It should be noted that the data points selected from the transducer data sets for Figure F-5 and the correlation plots for the other parameters were based on an estimation of the readings that were most representative of conditions at the time of sampling, since some of the transducer measurements were affected by movement of the transducers during sampling or purging of the wells. There were also measurements that occurred outside the range of anticipated conditions. These results do not always appear on the correlation figures due to the display ranges selected.

Conductivity

Figure F-6 shows the conductivity measurements taken during the quarterly sampling events using the YSI™ water quality meter. The transducer conductivity measurements are shown on Figure F-7 and the correlation between the quarterly measurements and the transducer data is shown on Figure F-8. There does not appear to be any systematic seasonal variation, except perhaps in the transducer data from MW-26 and MW-604 shown on Figure F-7. There appears to be an increase in conductivity in those two wells between February and July. Both are

shallow wells located in the center of the plume area. This may be due to increased precipitation and recharge during the spring and early summer. Also, the data show short-term reactions to precipitation events, which is indicative of ion loading of recharge through the site soils. The highest conductivity readings in both the quarterly and transducer measurements were in MW-704DD. The lowest conductivity readings were in MW-605D. Interestingly, these wells are in adjacent locations and have almost identical groundwater elevation measurements. Based on the conductivity variation in MW-704DD seen in Figure F-7, it appears that the conductivity values in that well are reduced by the removal of water during the quarterly sampling events and slowly recover with time. This indicates that groundwater from the shallow zone around the screen in MW-605D might be mixing with deeper groundwater in the screened zone in MW-704DD during the sampling events. Figure F-8 shows there is fairly good correlation between the quarterly and transducer conductivity measurements. It should be noted that the measurements from MW-707DD were extremely high in both the quarterly and transducer data sets; this well exhibits high total dissolved solids derived from high cation and anion concentrations unique to this well. The readings appear to be outside the design limits of the instruments (off-scale) and, therefore, were not shown on Figures F-6 and F-7.

pH

The quarterly pH measurements are shown on Figure F-9, the transducer pH data are shown on Figure F-10, and the correlation between the quarterly data from the YSI™ water quality meter and the transducer data is shown on Figure F-11. The transducer data from MW-604D, MW-605D, and MW-708DD are not shown because all three sensors appear to have malfunctioned during the monitoring period (all three recorded pH readings in excess of 12 standard units (SUs)). The quarterly pH measurements from the May 2012 sampling event (shown on Figure F-10) are also suspect: the readings from wells MW-604D, MW-605D, MW-713D, and MW-704DD were all below pH=7, which is lower than any of the other readings in those wells or the other wells during the DGI or the Supplemental Sampling. Figure F-11 indicates there is not very good correlation between the quarterly pH measurements and the transducer data. However, disregarding the May 2012 quarterly measurements, there is little variation in pH.

ORP

The ORP data are shown on Figures F-12 and F-13, and the correlation between the quarterly YSI™ data and transducer data is shown on Figure F-14. The quarterly ORP measurements indicate an increase in ORP during the summer (May sampling), but this is not reflected in the ORP readings from the transducers. The transducer data indicate that the ORP is fairly stable during the monitoring period, but there does appear to be a consistent decrease in the readings from July to October. This is also seen in the quarterly measurements. The decrease noted in the transducer data is most pronounced in wells MW-26, MW-604D, and MW-605D. These three

wells also had uranium concentration increases in the same period. Figure F-14 indicates there is fairly good correlation between the quarterly and transducer ORP measurements.

DO

The quarterly DO data are shown on Figures F-15. A review of the DO data indicates its usability is limited. The quarterly DO measurements show a large variation between wells and within some wells. These large variations might not be indicative of actual conditions. The transducer DO sensors appear to have been functioning, but the values recorded by the data loggers are outside the range of anticipated values - mostly small negative numbers were recorded for DO concentration and percent DO saturation. There was also not any apparent correlation between the quarterly and transducer DO data. Therefore, the transducer Do data are not presented. No discernable seasonal variation was apparent in the quarterly DO data.

Conclusion

The quarterly sampling and high-frequency monitoring conducted during the supplemental sampling period indicate that the concentrations of uranium and other parameters are fairly stable in the wells monitored. There were not any discernable seasonal variations that were consistent between wells; however, the data show short-term specific conductivity reactions to precipitation events, which is indicative of ion loading of recharge through the site soils.

APPENDIX G

Evaluation of Uranium Concentration Trends

Appendix G
Evaluation of Uranium Concentration Trends

Time trends in uranium concentrations at 18 wells were evaluated using graphical and statistical methods to determine if any significant trends are present. The wells selected for evaluation had four or more sample events and uranium (U) concentrations above 10 µg/L in one or more samples that were obtained over an approximately 5-year monitoring period. This concentration screening value was developed in a previous evaluation based on $^{234}U/^{238}U$ ratios. Samples with uranium concentrations below 10 µg/L have isotopic ratios that indicate a natural background source, whereas most samples with uranium concentrations above 10 µg/L have ratios that suggest a local contaminant source for the majority of the detected uranium. An additional 12 wells that were sampled four or more times are part of the monitoring network. Samples from these wells have on average less than 10 µg/L U and are not discussed here because they most likely represent background concentrations. A set of seven new wells that were sampled five times over a 1.2 year period are also evaluated here, although the monitoring period is too short to yield valid trends.

The 18 impacted wells were grouped for plotting purposes into four categories based on ranges of uranium concentrations so that the trends can be clearly seen on the trend plots. These categories are 10-15, 15-30, 30-90, and >90 µg/L U. This grouping allows three to six wells per plot, as shown on Figures G-1 through G-4. Most of the wells were sampled five times (November 2007, September 2009, September 2010, August 2011, and October 2012). Three of the wells with higher U concentrations (MW-26, MW-604D, and MW-605D) have more recent quarterly samples so nine samples are available for these wells.

The U concentrations shown on the plots were calculated by converting the activities (as pCi/L) of each of the ^{234}U, ^{235}U, and ^{238}U isotopes to mass (as µg/L) based on their specific activity constants (as Ci/g) and summed. Analyses of filtered (0.45 micron) samples were used in the evaluation. Duplicate results were averaged together for plotting purposes. Figures G-1 through G-4 do not appear to show any consistent trends over the 5-year monitoring period.

An additional perspective is provided in Figure G-5, which shows mean U concentrations for each of the five sample events calculated from the 18 impacted wells. Error bars are set equal to plus and minus one standard deviation for each sample event. This plume-wide mean perspective shows that the standard deviations in U concentrations at each sample event are of the same magnitude as the mean concentrations at each sample event, and that the differences in means between events is much less than the standard deviations of the individual means. These results imply that any trend in the plume-wide averages, if present, would not be detectable over the 5-year monitoring period.

Kendall-Tau Test of Trend

Kendall's tau, which is equivalent to the Mann-Kendall test, is used here as a trend estimator as recommended by the EPA. It compares repeated measurements of an analyte concentration over time, and tests the null hypothesis that the measurements exhibit no temporal trend. It is a nonparametric test, which means that it is based on the direction of change in concentration (up or down) over time rather than the magnitude of the change over time.

To perform the test, the *signs* (positive for increases, negative for decreases) of all possible pairs of data points are summed. For instance, if there are four sequential measurements (1, 2, 3, and 4), then the signs of 1 versus 2, 1 versus 3, 1 versus 4, 2 versus 3, 2 versus 4, and 3 versus 4 are summed. If there is no real trend, then the number of positive and negative signs will be roughly equal, although some differences would be expected due to chance. However, if there are many more increases than decreases between the pairs, then a real upward trend is indicated, and if there are many more decreases than increases between the pairs, then a real downward trend is indicated.

The test returns a *tau* coefficient that equals the sum of the signs divided by the total number of sample pairs available. If the concentrations consistently increase at each successive sample event, then *tau* equals +1, if the concentrations consistently decrease at each successive sample event, then *tau* equals –1, and if the number of positive and negative signs are equal, then *tau* equals zero. For all other arrangements *tau* lies between −1 and 1. The *tau* coefficient is converted to a *p*-value based on the normal distribution. The *p*-value can be thought of as the probability of the null hypothesis of no trend being true. The test was performed at a 95 percent confidence level, at which there is only a 5 percent chance of incorrectly accepting the null hypothesis (no trend is present) when a trend actually is present. At this confidence level, *p*-values below 0.05 indicate a statistically significant trend, whereas *p*-values above 0.05 indicate that any apparent trend is likely due to chance and is not significant.

Trends at all 30 wells (impacted and unimpacted wells sampled four or more times) were tested. Test results are shown in Table G-1. Of the 30 wells that were monitored for approximately 5 years, MW-3 and MW-602D are the only ones that show significant trends. MW-3 is a background well with a significant downward trend, and MW-602D is an impacted well with a significant downward trend.

Table G-1 also shows the results of the seven new wells based on four or five quarterly samples with a monitoring period of 0.7 to 1.2 years (note: no isotopic U data were obtained for well MW-707DD in August 2011 because the well was dry). These results are provided for completeness and are not considered to be evidence for any real trends because the component of

variance due to analytical uncertainties is larger than the variance due to any trends. These results show three significant downward trends and one significant upward trend. Given that a stable plume has been in existence for several decades, it is unlikely that trends, if present, at these locations would be detectable over a 1.2 year monitoring period.

In summary, the graphical and statistical results of trend evaluations at the 30 wells that have been monitored for 5 years indicate that no statistically significant trends in uranium concentrations are detectable.

Table G-1. Kendall-Tau Trend Test Results

APPENDIX C

Niagara County Department of Health Well Survey,

Guterl Steel Site Vicinity Summary of Results (2012)

NIAGARA COUNTY DEPARTMENT OF HEALTH
ENVIRONMENTAL HEALTH DIVISION
5467 Upper Mountain Road, Suite 100
Lockport, New York 14094-1894

(716) 439-7444
(716) 439-7427 FAX

July 23, 2012

Sheila Hint
Environmental Engineer
US Army Corps of Engineers
1776 Niagara St. Buffalo, NY 14207

Re: NCDOH Well Survey
Guterl Steel Site Vicinity
Summary of Result

Dear Ms. Hint,

The Niagara County Department of Health undertook a well survey of a select area of residential properties in the City of Lockport (1/2 mile radius from Guterl Steel on Ohio Street) with the purpose to attempt to identify the location, operability and current use of all existing groundwater wells in the study area. It is noted that public water supply by the City of Lockport is supplied to all subject properties.

A Letter with a Well Water Questionnaire and an envelope with return postage was mailed April 30, 2012 to 196 residents. Non-responders were followed up with a telephone call when a telephone number was available. A second mailing was sent out June 6, 2012 to remaining non-responders.

The results as of this date are as follows;
49 property owners did not respond.
138 responded there was no well present
9 property owners reported one or more wells on the property but no well was in use.

Of the 9 properties, 10 wells were identified;
-3 wells were reported to be filled in and permanently abandoned
-2 property owners list there wells as abandoned but do not indicate if they could be made operable and have not responded to follow-up inquiries.
-1 well is to be permanently abandoned soon due to a scheduled house addition. No well sampling was requested.
-1 property owner with two wells has no intention of activating and does not request any sampling.

-1 property owner has no intention of using well but requests verification through well sampling that contamination has not spread to property. The well is currently covered and would need to be located.

-1 property owner was contemplating making well operable for landscaping purposes and asks that the USACE sample the water to insure Guterl Site Contaminants are not present.

The Department formally requests on behalf of the last two property owners located on Crosby Avenue be contacted by your office to discuss the investigation of Guterl and how sampling of their well might improve that investigation and provide assurance that contamination has not migrated to adjacent properties to the east of Guterl.

You may direct any questions regarding this survey and the names and addresses of residents requesting further sampling to Paul Dicky, P.E., Supervising Public Health Engineer at 439-7595.

Very truly yours,

James J. Devald, P.E.
Director of Environmental Health

1.0 INTRODUCTION

CB&I Federal Services LLC (CB&I), working under contract with the United States Army Corps of Engineers (USACE), Buffalo District Contract Number W912QR-08-D-0013, Delivery Order No. DN03, has prepared this Mass Balance Calculation report for the former Guterl Specialty Steel Corporation Site (Guterl Site) (previously known as the Simonds Saw and Steel Company [Simonds]). The processing of natural uranium metal at the Guterl Site resulted in dust, mill shavings, and associated land disposal that contaminated on-site soils and facility buildings. The contaminated soils act as potential sources of the uranium-impacted groundwater. Groundwater in the shallow, as well as deep, bedrock underlying the Guterl Site has been documented to be impacted with uranium, as described in the Remedial Investigation (RI) Report (USACE, 2010), the data obtained during subsequent data gap investigation (DGI) conducted in 2011 (USACE, 2012a, b), and supplemental sampling performed (USACE, 2013).

1.1 Background

Findings of the DGI (USACE 2012b) indicate that uranium in groundwater underneath the site is migrating toward the Erie Canal. The Erie Canal is located across from the southeastern boundary of the site parallel to Ohio Street, approximately 90 meters (m) (300 feet [ft]) south of the site. As shown in Figure 1, seeps were observed during the DGI at eight unique locations along the northern wall of the Erie Canal.

The Erie Canal is excavated into bedrock along the channel length that is adjacent to the site. In the vicinity of the Guterl Site, the Erie Canal flows from west to east, from the Niagara River toward Lockport Locks 34 and 35, northeast of the Guterl Site. The surface water elevation in the Erie Canal immediately south of the Guterl Site fluctuates by several feet due to seasonal control of the navigable water level. From November 20 through April 20, the lower Erie Canal is dewatered (below the Lockport Locks between the bulkhead in Pendleton, New York, and the Genesee River), and there is no measurable flow in the vicinity of the emergency water intake shown in Figure 1. The water elevation is lowered during these winter months with less than 0.6 m (2 ft) of standing water in the Erie Canal. Between spring and fall, from April 20 through November 20, the Erie Canal is made navigable by raising the water levels to 3.6 m (12 ft). During this period, the average flow rate is 0.6 m per second (2 ft per second) (USACE, 2010).

1.2 Purpose and Objectives

To demonstrate that the risk of future exposure from the ingestion of uranium released from the site groundwater to the Erie Canal waters is minimal, calculations were performed to estimate the effects of the mixing of site groundwater with Erie Canal water. The resultant concentrations of uranium in Erie Canal surface waters were obtained from these calculations. A dilution ratio was used to back-calculate the maximum uranium concentration in Guterl Site groundwater that, after seeping into the Erie Canal, could result in elevating the uranium concentrations in the Erie Canal above the drinking water standard of 30 micrograms per liter (µg/L), which is the federal maximum contaminant level (MCL) established by the U.S. Environmental Protection Agency (U.S. EPA). Details of the approach and results are presented in the following sections.

2.0 REMEDIAL INVESTIGATION AND DATA GAP INVESTIGATION DATA SUMMARY

2.1 Site Groundwater Levels

Figure 2 shows that the August 3, 2011, shallow groundwater level elevations along the southeastern Guterl Site boundary ranged from 179.02 m (587.34 ft) above mean sea level (msl) at MW-713D to 175.09 m (574.46 ft) above msl at MW-712D. Figure 2 also shows the locations and the elevations of the seeps that were observed to discharge to the Erie Canal. The elevations of these seeps were 173.95 m (570.7 ft) above msl and 174.25 m (571.7) ft above msl, which were 1.15 m (3.76 ft) and 0.84 m(2.76 ft) lower than the lowest groundwater elevation measured at the Guterl Site boundary. The groundwater elevations and flow directions shown on Figure 2, when compared to the seep elevations, indicate that shallow bedrock groundwater is discharging to the Erie Canal as seeps.

Figure 3 shows that the groundwater elevation in monitoring well MW-712DD, located along the southeastern Guterl Site boundary, was 172.56 m (566.15 ft) above msl on August 3, 2011. This elevation is lower than the elevation of either of the two seeps observed on August 3, 2011, which were 173.95 m (570.7 ft) above msl and 174.25 m (571.7) ft above msl. This indicates that the deep bedrock groundwater is not the origin of the observed seeps. This deep groundwater flows toward the Erie Canal, yet cannot be directly observed as seeps. When the Erie Canal water level is lower in the winter ice falls are evident; however, the source seeps cannot be distinguished.

2.2 Erie Canal Surface Water Sampling

Surface water samples were collected from 12 locations in the Erie Canal on September 12, 2007, during the RI. Three of these locations were upstream of the Guterl Site groundwater discharge to the Erie Canal and had total uranium concentrations that were less than 1 µg/L, ranging from 0.3 to 0.4 µg/L. This range is considered ambient or background concentrations for the Erie Canal based on the samples taken during the RI. The other nine samples, collected at locations where groundwater flow from the Guterl Site could potentially discharge to the Erie Canal, also had total uranium concentrations less than 1 µg/L, ranging from 0.3 to 0.7 µg/L. As shown on Figure 1, surface water samples were collected during the DGI at two locations on May 7, 2012, (0.5 µg/L total uranium in both samples), one of which was resampled on October 25, 2012 (0.6 µg/L total uranium). All sample results indicate that only background concentrations of uranium were detected in the surface water in the Erie Canal.

Emergency drinking water for the City of Lockport is occasionally supplied from the Summit Street intakes located in the Erie Canal immediately southeast of the site (New York State Department of Environment Conservation, 1994). According to Niagara County Health Department, the most recent use of the emergency water intakes occurred September 16 and 18, 1990, August 10, 1992, November 2, 1992, May 18, 1993, September 18, 1993, and July 1997 (specific date not available) (New York State Department of Health, 2008). Two surface water samples were collected on May 7, 2012, and on October 25, 2012, near the emergency water intake (Figure 1). The total uranium concentration in these samples ranged from 0.5 to 0.6 µg/L, which falls within the range of other water sample results from the Erie Canal and is

attributed to naturally occurring uranium.

In summary, the surface water samples collected at locations where site groundwater may discharge in the Erie Canal and at the emergency water intake, show uranium concentrations ranging from 0.3 to 0.7 µg/L. These concentrations are not distinguishable from background surface water uranium concentration of 0.4 µg/L and are below the total uranium MCL of 30 µg/L.

2.3 Erie Canal Seep Surveys

As part of the DGI, a reconnaissance survey was conducted on September 8, 2011, to document the locations of groundwater seeps along the Erie Canal, and collect samples representing the discharge of site groundwater to the Erie Canal. The Erie Canal walls were visually inspected for evidence of seeping groundwater along an approximate 1.21 kilometer (0.75 mile) section of the Erie Canal, which was bounded by the Lockport Bypass located upstream of the Guterl Site and the Stevens Street Bridge located downstream of the site. No seeps were observed along the southern rock face of the Erie Canal. Seeps were observed at two locations along the northern rock face of the Erie Canal. Seep samples were collected at Seep-1108-01 and Seep-1108-02 (Figure 1). Seep-1108-01 was located approximately 90 m (300 ft) downstream of a pipeline crossing the Erie Canal and 1.8 m (6 ft) above the water surface in the Erie Canal, while Seep-1108-02 was located approximately 46 m (150 ft) downstream of the Lockport Bypass and 1.5 m (5 ft) above the water surface in the Erie Canal. The elevations of the two seeps are higher than the elevation of the base of the shallow bedrock groundwater zone, indicating that groundwater seepage to the Erie Canal originates from the shallow bedrock. The concentration of total uranium (unfiltered) in Seep-1108-01 was 44.9 µg/L, which exceeds the total uranium MCL for drinking water, while Seep-1108-02 had a total uranium (unfiltered) concentration of 6.3 µg/L.

A second survey of the Erie Canal was conducted on December 7, 2011. Seep locations are displayed as Seeps 1112-01 through 1112-06 on Figure 1. Six locations were identified where groundwater was observed to seep through the northern wall of the Erie Canal; Seep-1112-03 was co-located with the Seep-1108-01 that was sampled in August 2011.

Total uranium (unfiltered) concentrations in the seeps ranged from 3.5 µg/L at Seep-1112-02 to 25.9 µg/L at Seep-1112-04. None of the samples exceeded the total uranium MCL for drinking water. During this sampling event, the Erie Canal was seasonally drained of water, with only small accumulations of water remaining at the canal bottom. The December seep elevations were higher than the August seep elevations. In August, the seeps were 1.8 to 2.0 m (6 to 6.5 ft) above the navigation season water surface. The December seeps were observed at approximately 6 m (20 ft) higher than the non-navigation water surface, equivalent to 2.4 to 3.0 m (8 to 10 ft) above the navigation season water level, or approximately 0.6 to 1.2 m (2 to 4 ft) higher than the August seep elevations.

A third survey of the Erie Canal walls was conducted on May 7, 2012. Three locations were identified where groundwater was observed to seep through the northern wall of the Erie Canal; two of which, Seep-1205-01 and Seep-1205-03, were collocated with Seep-1108-02 and Seep 1108-01, respectively, that were sampled in August 2011. The seep locations are displayed as Seep-1205-01 through Seep-1205-03 in Figure 1. Total uranium (unfiltered)

concentrations in the seeps ranged from 5.3 µg/L at Seep-1205-01 to 20.7 µg/L at Seep-1205-03, all below the total uranium MCL for drinking water.

3.0 GROUNDWATER / SURFACE WATER MIXING CALCULATIONS

3.1 Groundwater Discharge Rate

Groundwater from the Guterl Site migrates toward the Erie Canal through a weathered fractured bedrock system. In contrast to a homogenous porous media, where groundwater flows through the entire saturated medium, flow in fractured rock occurs through a small fraction of the rock mass, while the remainder of the rock mass is competent and does not have connected void spaces through which groundwater can flow. The rate of groundwater flow, represented by groundwater velocities through individual fractures can be high, akin to flow through a narrow diameter conduit; however, the fractures usually occupy only a very small fraction of the bedrock groundwater system. Therefore, even when groundwater velocities through individual fractures may be high, the average volumetric flow rates through the fractured system can be low.

Groundwater flowing through the fracture system underlying the Guterl Site carries dissolved uranium to the Erie Canal, where the groundwater has been observed to seep through the Erie Canal wall, as previously discussed. Although long-term data are not available, observations made since August 2011 indicate that the seeps are low volume (less than 1 gallon per minute flow), and limited to eight distinct locations above the water line. Although this low-volume discharge contains dissolved uranium, the mixing with a much larger volume of water in the Erie Canal causes significant dilution.

Mixing calculations were performed assuming worst-case conditions: groundwater discharges to the Erie Canal from a contiguous seepage face along the width of the uranium plume greater than 30 µg/L, as delineated on Figure 4. The driving groundwater flow condition is considered an equivalent porous media, where groundwater flows through the entire saturated media rather than discrete fractures.

The average groundwater discharge rate from the shallow groundwater to the Erie Canal was calculated using Darcy's Law as follows:

$$Q_{gw} = \frac{KiA}{n_e} = \frac{Kiwb}{n_e}$$

Where:

- Q_{gw} is the average groundwater discharge rate [L^3/T]
- K is the hydraulic conductivity [L/T]
- i is the hydraulic gradient [L/L]
- A is the cross-sectional area through which groundwater flows [L^2]
- w is the width of the groundwater discharge zone [L]
- b is the depth of the discharge zone [L]

- n_e is effective porosity of shallow bedrock [dimensionless]
- K = 3.5 x 10^{-5} m/sec (10 ft/day), geometric mean of the shallow bedrock slug test measurements (USACE, 2012b)
- i = 0.0602 m/m (ft/ft), measured between shallow wells MW-604D and MW-712D, located south of the former buildings area toward the Erie Canal
- w = 229 m (750 ft), measured from Figure 4 as the width of the groundwater discharge zone at the Erie Canal where uranium concentration exceeds 30 µg/L
- b = 5.6 m (18.5 ft), conservatively estimated as the entire vertical extent between the average August 2011 seep elevation (174.1 m [571.2 ft]) and the Erie Canal bottom elevation (168.5 m [552.7 ft])
- n_e = 0.05, estimated for bedrock in vicinity of the Erie Canal

The average groundwater flow rate, Q_{gw}, was calculated to be 5.4 x 10^{-2} cubic meters per second (cms) (167,000 cubic ft per day or 1.9 cubic ft per second [cfs]). This is a conservatively high estimate that assumes the shallow groundwater plume discharges to the Erie Canal across a fully saturated vertical section that extends from the top of the observed seeps to the Erie Canal bottom.

3.2 Erie Canal Flow

The volumetric flow rate in the Erie Canal was estimated as follows:

$$Q_{canal} = W\ D\ V$$

Where:

- Q_{canal} is the Erie Canal discharge rate [L^3/T]
- W is the width of Erie Canal [L]
- D is the height of water column in the Erie Canal [L]
- V is the velocity of water in the Erie Canal [L/T]

The following inputs were used.

W = 28.7 m (94 ft), width of the Erie Canal upstream of Lock 34/35, New York State Canal Corporation communication to USACE, dated April 6, 2012 (USACE, 2012a)

D = 3.7 m (12 ft), height of water in the Erie Canal upstream of Lock 34/35, New York State Canal Corporation communication to USACE dated April 6, 2012 (USACE, 2012a)

V = 0.6 m/sec (2 ft/sec) (USACE, 2010)

The Erie Canal flow, Q_{canal}, was calculated to be 65 cms (2,300 cfs).

3.3 Uranium Concentration Dilution Factor

During the navigation season, lasting between April 20 and November 20, groundwater containing uranium from the Guterl Site to the Erie Canal mixes with the flow in the Erie Canal

and is diluted. The dilution ratio is calculated as follows:

Dilution Factor = Q_{canal} / Q_{gw}
= 65 cms (2,300 cfs) / 5.4 x 10^{-2} cms (1.9 cfs)
= 1,200

During the non-navigation season (November 21 to April 19), there is no measurable flow in the canal in the vicinity of the emergency water intake, therefore, the Erie Canal does not function as a potential emergency water supply source during this time period. Any seep mixes with the approximately 0.6 m (2 ft) of standing water in the Erie Canal. Considering that the observed seep flow rates are low (approximately 6.3 x 10^{-5} cms [0.002 cfs]), the risk of incidental exposure from ingestion of uranium in the emergency drinking water supply is absent. In addition, during the non-navigable period, human access to the Erie Canal is constrained by its canyon-like configuration and limited entry points in Lockport approximately 1.6 kilometer (1 mile) to the east.

4.0 MAXIMUM URANIUM CONCENTRATION IN THE ERIE CANAL

The highest measured total uranium concentration at the Guterl Site is 292 µg/L, measured in May 2014 at monitoring well605D. If this concentration was directly transferred to the Erie Canal, thereby ignoring in-aquifer dispersion, the uranium would be diluted by a factor of 1,200. The resulting maximum possible transferred concentration in Erie Canal water would be 0.24 µg/L total uranium. When added to the background uranium concentration of 0.4 µg/L total uranium it would result in a surface water concentration of 0.64 µg/L total uranium in the Erie Canal. This estimated maximum concentration is well below the 30 µg/L MCL for drinking water and is non-distinguishable from the observed background concentration range in the Erie Canal (0.3 to 0.7 µg/L).

5.0 MAXIMUM TOLERABLE GUTERL SITE GROUNDWATER CONCENTRATION

To pose a risk to the emergency water intake in the Erie Canal, the groundwater concentration discharging from the site would have to overcome the dilution factor in the Erie Canal. The maximum uranium concentration in Guterl Site groundwater that would create an exceedance of the uranium MCL in the Erie Canal is calculated as follows:

Maximum Tolerable Groundwater Concentration = (MCL – background) x dilution factor
= (30 µg/L – 0.4 µg/L) x dilution factor
= 29.6 x 1,200
= 35,500 µg/L

Therefore, groundwater seeping from the Guterl Site must not exceed 35,500 µg/L to ensure protection of human health during an emergency water-intake operation.

An evaluation of the current and future possibility of exceeding the uranium MCL in the Erie Canal was performed based on measured groundwater concentrations and model-predicted

groundwater concentrations for various remedial alternatives. These alternatives include no soil removal action, soil removal to construction worker protection standards, and soil removal to groundwater protection standards. Results are provided in Table 1. The maximum predicted groundwater uranium concentration is 35,280 µg/L, occurring approximately 20 years in the future for the alternative where no soil removal action is undertaken. This concentration is less than the maximum tolerable groundwater concentration of 35,500 µg/L. A no soil removal action is not a viable remedial alternative for this site. Therefore, it is not likely that the uranium concentration in the Erie Canal will exceed the MCL in the next 1,000 years. The site-wide remedial action alternatives for the Guterl site include soil removal for the groundwater protection preliminary remediation goal.

6.0 CONCLUSIONS

In order to demonstrate that the risk of future exposure from the ingestion of uranium released from the Guterl Site groundwater to the Erie Canal waters is minimal, mass balance calculations were performed. Findings of the calculations are listed below:

- Groundwater flowing through the fracture system underlying the Guterl Site carries dissolved uranium to the Erie Canal, where the groundwater has been observed to seep through the Erie Canal wall.

- Although long-term data are not available, observations made since August 2011 indicate that the seeps are low flow volume approximately 6.3×10^{-5} cms [0.002 cfs]) and limited to approximately eight locations.

- During the navigation season (April 20 and November 20), the low volume seep discharge mixes with a larger volume of water in the Erie Canal causing significant dilution. A dilution factor of 1,200 was calculated.

- During the non-navigation season (November 21 to April 19), there is no measurable flow in the Canal in the vicinity of the emergency water intake, and therefore, the Erie Canal does not function as a potential emergency water supply source during this time period. In addition, during the non-navigable period, human access to the Erie Canal is constrained by its canyon-like configuration and limited entry points.

- The highest measured total uranium concentration at the Guterl Site is 292 µg/L. If this concentration was directly transferred to the Erie Canal, after dilution the resulting maximum possible concentration would be 0.24 µg/L, which, when added to the background uranium concentration of 0.4 µg/L, results in a maximum surface water concentration of 0.64 µg/L total uranium in the Erie Canal. The estimated maximum concentration is well below the MCL for drinking water and is non-distinguishable from the currently observed background concentration in the Erie Canal (0.3 to 0.7 µg/L).

- To pose a future risk to the emergency water intake in the Erie Canal, the groundwater concentration discharging from the site would have to overcome the

dilution in the Erie Canal. The maximum uranium concentration that would create an exceedance of the uranium MCL in the Erie Canal is calculated to be 35,500 µg/L.

- The maximum predicted groundwater uranium concentration is 35,280 µg/L, occurring 20 years in the future for the scenario where no soil removal action is undertaken. This concentration is less than the maximum tolerable groundwater concentration of 35,520 µg/L.

- It is not likely that the uranium concentration in the Erie Canal will exceed the MCL at any time between present and next 1,000 years.

Surface Water Sample Locations

Feature Descriptions

- Basement
- Basin
- Catch Basin
- Vault
- Drain Pipe
- Floor Trench
- Furnace pit
- ? Inaccessible
- Oil/Water Separator
- Outfall
- Pumphouse Reservoir
- Sewer Manhole
- Manhole
- Buildings

Notes:
pCi/L - picocuries per liter
All radiological results are presented in pCi/L.
U-235 concentration includes U-236, if present.
Uranium and thorium isotopes determined by alpha spectroscopy, radium isotopes determined by gas flow proportional counting.

United States Army Corps of Engineers
Buffalo District

GUTERL SPECIALTY STEEL CORPORATION
LOCKPORT, NY

NON-NATIVE SURFACE WATER

Notes:
pCi/g – picocuries per gram
All radiological results are presented in pCi/g.
U-235 concentration includes U-236, if present.
U-234, U-235, U-238, Th-228, Th-230, and Th-232 were analyzed by alpha spectroscopy.
Ra-226 and Ra-228 were analyzed by gamma spectroscopy.

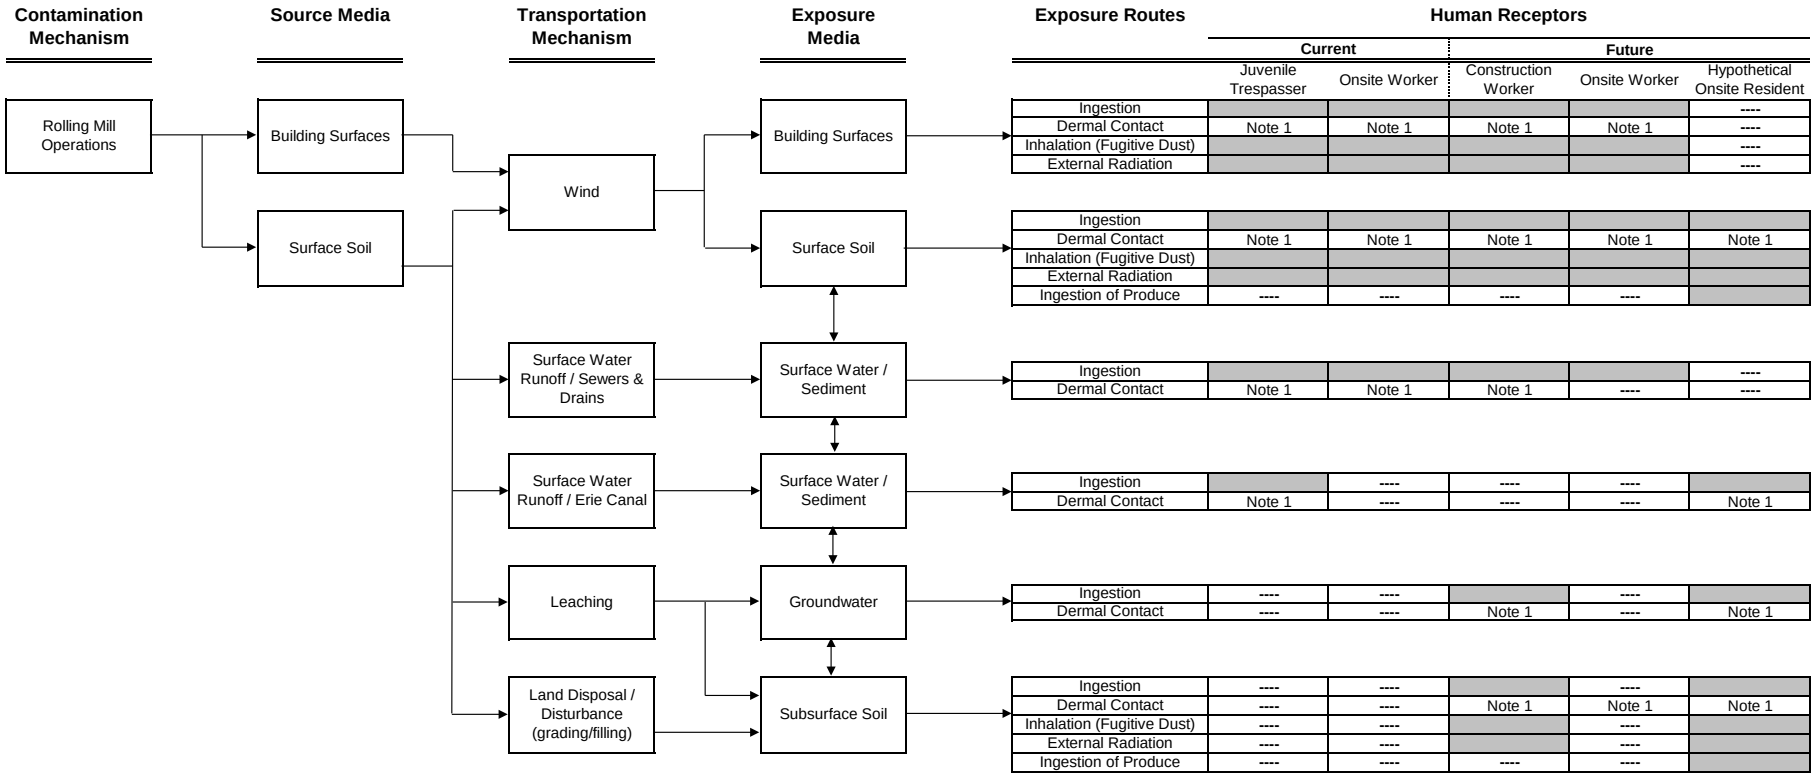
Generalized Conceptual Site Model
Potential Pathways for Human Exposure
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York



Note 1: Dermal contact with this medium is possible for this receptor but is not significant for the radionuclides present at this site because of their very low absorption rates. Therefore, this exposure route will not be evaluated quantitatively in the human health risk assessment.

TABLES

TABLE 2-1
SUMMARY OF EXCISED AREA BUILDINGS
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

Building	Year	~ Floor Space		Use of Building
#	Built [a]	(sf)	(sm)	
1	1913	8780	816	Manufactured Gas House, Metal Smelting (USACE, 2001)
2	1914	68900	6401	Metal Rolling/Manufacturing (ORNL, 1978)
3	1920/1946/1951	67800	6299	Mill Area/Metal Rolling and Grinding (ORNL, 1978); additions to north and south, respectively.
4	1920/1951	28000	2601	Mill Area/Metal Rolling/Manufacturing and Loading Dock (ORNL, 1978); addition to west.
9	1918/1951	19400	1802	Mill Area/Metal Rolling/Manufacturing and Loading Dock (ORNL, 1978); addition to west.
5	1918	3770	350	Housed Heat Exchanger (ORNL, 1978); Transformer Station and Power House (ORISE, 1999)
6	1918	15090	1402	Metal Rolling and Loading Dock (ORNL, 1978)
8	1918	27880	2590	Metal Rolling and Loading Dock (ORNL, 1978); Cold Rolling (ORISE, 1999)
24SW	1941/1951	10750	999	Mill Area (ORNL, 1978); Allegheny general storage (ORISE, 1999); addition to north.
24SE	1959	19350	1798	Mill Area (ORNL, 1978); Allegheny general storage (ORISE, 1999)
24N	1966	36250	3368	Mill Area (ORNL, 1978); Allegheny general storage (ORISE, 1999)
35	1950	3280	305	Metal Rolling and Grinding (USACE, 2001); Allegheny general storage (ORISE, 1999)

Notes:

[a] Dates of construction are based on Industrial Risk Insurers, 1985. Additions to original construction are listed to the right of original construction date.

[b] Building 24 is not in the Excised Area but is included here to consolidate this basic information.

(sf) - square feet

(sm) - square meters

SW - southwest

SE - southest

N - north

TABLE 3-4
SCREENING LEVELS FOR BUILDING SURFACES
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

Nuclide [a]	***Average (dpm/100 cm^2)*** [b c]	***Maximum (dpm/100 cm^2)*** [b d]	***Removable (dpm/100 cm^2)*** [b e]
Natural U, ^{235}U, ^{238}U and associated decay products [f]	5,000	15,000	1,000
Natural Th, ^{232}Th [f]	1,000	3,000	200

Notes:
[a] Where surface contamination by both alpha- and beta/gamma-emitting nuclides exists, the limits established for alpha- and beta/gamma-emitting nuclides should apply independently.
[b] As used in this table, dpm (disintegrations per minute) means the rate of emission by radioactive materials as determined by correcting the counts per minute observed by an appropriate detector for background, efficiency and geometric factors associated with the instrumentation.
[c] Measurements of average contaminant should not be averaged over more than 1 square meter. For objects of less surface area, the average should be derived for each object.
[d] The maximum contamination level applies to an area of not more than 100 cm^2.
[e] The amount of removable radioactive material per 100 cm^2 of surface area should be determined by wiping that area with dry filter or soft absorbent paper, applying moderate pressure, and assessing the amount of radioactive material on the wipe with an appropriate instrument of known efficiency. When removable contamination on objects of less surface area is determined, the pertinent levels should be reduced proportionally and the entire surface should be wiped.
[f] The radium isotopes are progeny in the thorium and uranium decay chains and, hence, the listed values include them with their parent radionuclides.

Notes:

[a] The three values shown for each method and COPC are the minimum reported concentration, the weighted average concentration, and the maximum reported concentration.

[b] ^{228}Ra and ^{228}Th concentrations derived from ^{232}Th concentration assuming secular equilibrium.

[c] ^{234}U concentration derived from ^{238}U concentration assuming secular equilibrium.

[d] ^{235}U concentration derived from ^{238}U concentration assuming natural abundance.

[e] Gamma spectroscopy ^{238}U concentrations from the offsite laboratory are not used in this report because of concerns about their accuracy. They are shown for information purposes only.

[f] Bracketed numbers are the laboratory reporting limits. Specific activity of ^{238}U is 0.336 pCi/µg (converted from value in Table 3.4.1-8), so (0.7 ± 0.4) µg/g × 0.336 pCi/µg = (0.25 ± 0.15) pCi/g.

[g] This laboratory-reported value is greater than the laboratory detection limit but less than the laboratory reporting limit.

Notes:
Samples were analyzed at the off-site laboratory for isotopic uranium and isotopic thorium by alpha spectroscophy; a minimum of 50% of samples were analyzed for isotopic radium by gas flow proportional counting.
Blank cell indicates no sample for the medium and IA/EU other than what is indicated in occupied cells.
[a] No exposure units are associated with IA06, Off-Site NE Properties, as this area is considered non-impacted and will be designated for No Further Action.
[b] No exposure units are associated with IA07, Groundwater, as data from each monitoring well will be evaluated with the other media for each exposure unit within which it lies.
[c] No exposure units are associated with IA08, Site Utilities, as sediment or surface water data from each ditch or trench will be evaluated with the other media for each exposure unit within which it lies.
[d] Volumentric background reference samples for building materials were collected as Class 3 samples within the Excised Area to avoid damaging existing structures outside of the area.
[e] Soil background samples were not assigned an exposure unit number; soil background was not designated as surface or subsurface soil.
[f] This sample was collected immediately below the current building floor and is considered a surface soil sample for exposure purposes assuming that the building will be demolished.
[g] B02SL-721-01 and B02SL-739-01 are detritus samples being evaluated with surface soil data because they are dust/dirt and more closely resembled soil matrix (see Section 3.7.3 for more detail).
[h] Samples A02SL-012-01 and A04DSL-204-01 were only analyzed for Ra and not for isotopes of U and Th.
[i] A02SL-003-01 was originally labeled as A02SL-703-01. Surface soil collected at A02-003 location could not be drilled due to utility access issues; it was not collected by drilling.
[j] Sample A10SL-301-01 is a surface soil sample collected just outside the boundary of EU20 to delineate the extent of contamination it EU20.
EU = exposure units
IA = investigative area
NCIDA = Niagara County Industrial Development Agency
NE = northeast

TABLE 6-4
RECEPTOR-SPECIFIC AND SCENARIO-SPECIFIC RESRAD PARAMETER VALUES
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

RESRAD Parameter	Units	RESRAD Default	Risk Variability[a]	Proposed Values[b]	Receptor or Scenario	Comment/Reference
Area of contaminated zone	m^2	10,000	3	67000	All receptors	Contaminated zone selected to represent all terrestrial EUs; individual EU values presented on Table 6-5
Thickness of contaminated zone	m	2.0	1	1	All receptors	Thickness of contaminated zone selected to represent all terrestrial EUs; individual EU values presented in Table 6-5
Length parallel to aquifer flow	m	100	4	600	All receptors	Value selected based on actual length of plume parallel to aquifer flow; individual EU values presented in Table 6-5
Time since placement of material	yr	0.0	-	Use default	All receptors	Using site-specific modeling option
Cover depth	m	0.0	3	Use default	All receptors	Cover will eliminate direct ingestion and inhalation pathways
Density of cover material	g/cm^3	1.5	3	Not used	All receptors	According to Manual Appendix A and E and DCH Section 2, omitted if cover depth = 0; geologist/hydrologist consulted
Cover depth erosion rate	m/yr	0.001	5	Not used	All receptors	If cover erodes, direct ingestion and inhalation pathways are relevant
Density of contaminated zone	g/cm^3	1.5	4	1.31	All receptors	Based on combining averages for each area
Contaminated zone erosion rate	m/yr	0.001	3	6.00E-05	All receptors	Can erode entire contaminated lens if value is large enough; assumed a conservative 2% slope and nonfarming use; DCH manual Section 14 for further discussion
Contaminated zone total porosity	unitless	0.4	5	0.3	All receptors	Geotech evaluation based on soil moisture of 15% for tills
Contaminated zone field capacity	unitless	0.2	7	0.15	All receptors	Based on available water content of 15%
Contaminated zone hydraulic conductivity	m/yr	10	7	3.15	All receptors	Based on native soil Shelby tube permeability lab tests (avg of two tests 1.3E-06 cm/sec), NYSDEC 2000 reference of 3.67E-07 cm/sec for a remolded sample, and Earth Tech geotechnical assessment of soil boring data (i.e., theoretical range based on soil types) of 1E-05 cm/sec to 1E-07 cm/sec
Contaminated zone b parameter	unitless	5.3	7	7.3	All receptors	Based on average manual and low hydraulic conductivity of till and silty clay soil type
Average annual wind speed	m/sec	2.0	6	4.5	All receptors	Averaged between Rochester and Buffalo windspeeds
Evapotranspiration coefficient	unitless	0.5	5	5.70E-01	All receptors	Based on average site-specific information; geologist/hydrologist consulted
Precipitation	m/yr	1.0	5	0.94	All receptors	Obtained from SEVIEW Climatic Database for Lockport 2 NE
Irrigation (I_r)	m/yr	0.2	5	0.2	Gardening	Small home garden will require watering.
Irrigation mode	unitless	Overhead	-	Use default	Gardening	Used in residential future scenario
Runoff coefficient	unitless	0.2	5	2.50E-01	All receptors	Value was selected to reflect poor drainage and silty soils that show infiltration and leaching capacity.
Watershed area for nearby stream or pond	m^2	1E+06	5	Use default	All receptors	Surface water dependent pathways; see Manual Appendix E and DCH Section 17
Accuracy for water/soil computations	unitless	0.001	-	Use default	All receptors	Related to water/soil concentration ratios; see Manual Appendix E
Saturated zone density	g/cm^3	1.5	4	2.61	All receptors	Estimate for dolostone based on reference[c] and USACE data.
Saturated zone total porosity	unitless	0.4	4	0.13	All receptors	Based on average site-specific information; geologist/hydrologist consulted
Saturated zone effective porosity	unitless	0.2	3	0.03	All receptors	Based on average site-specific information; geologist/hydrologist consulted
Saturated zone field capacity	unitless	0.2	7	0.03	All receptors	Geologist/hydrologist consulted
Saturated zone hydraulic conductivity	m/yr	100	3	1,540	All receptors	Geomean of measured hydraulic conductivity of bedrock and model manual; hydraulic conductivities ranged from 7.1x10E-05 cm/sec at monitoring well MW-15 to 8.9x10E-02 cm/sec at monitoring well MW-3. The average hydraulic conductivity for the site is 4.91x10E-03 cm/sec.
Saturated zone hydraulic gradient	unitless	0.02	3	0.007	All receptors	Based on site data
Saturated zone b parameter	unitless	5.3	7	2	All receptors	Average; based on geomean of measured hydraulic conductivity of bedrock and model manual
Water table drop rate	m/yr	0.001	7	0.87	All receptors	Value derived from natural seasonal variation and not due to pumping; seasonal low in November subtracted from seasonal high in March.
Well pump intake depth (m below water table)	m	10	5	Use default	All receptors	No site-specific pumping information available; assuming default.

TABLE 6-4
RECEPTOR-SPECIFIC AND SCENARIO-SPECIFIC RESRAD PARAMETER VALUES
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

RESRAD Parameter	Units	RESRAD Default	Risk Variability[a]	Proposed Values[b]	Receptor or Scenario	Comment/Reference
Model: Nondispersion (ND)	unitless	ND		Site-specific	All receptors	See Manual Appendix E
Well pumping rate	m^3/yr	250	4	Use default	All receptors	No site-specific pumping information available; assuming default.
Number of unsaturated zone strata[d]	unitless	1	-	1	All receptors	Combined native soil and fill; assume all properties similar for both soil types
Unsaturated zone thickness	m	4.0	4	0.3	All receptors	Approximate average thickness based on RI boring data.
Unsaturated zone soil density	g/cm^3	1.5	7	1.31	All receptors	Based on combining averages for each area
Unsaturated zone total porosity	unitless	0.4	7	0.3	All receptors	Geotech evaluation based on soil moisture of 15% for tills
Unsaturated zone effective porosity	unitless	0.2	7	0.15	Resident, construction worker	Geotech evaluation based on soil properties; on-site worker and juvenile trespasser have drinking water pathway supressed, therefore not applicable.
Unsatuated zone field capacity	unitless	0.2	7	0.15	All receptors	Based on available water content of about 15%
Unsaturated zone b parameter	unitless	5	7	7.3	All receptors	Average; based on manual and low hydraulic conductivity of till and silty clay soil type
Unsaturated zone hydraulic conductivity	m/yr	10	7	3.15	All receptors	Based on lab tests and geotech evaluation of expected value
Distribution coefficients	cm^3/g	-[e]	4	Site-specific[f]	All receptors	Radionuclide-specific; impacts all pathways, not just groundwater
Inhalation rate	m^3/yr	8,400	6	Site-specific	All receptors	Average over entire 365-day year; default equivalent to 0.9589 m^3/hr
				5,548	Resident adult	Assuming adult male rate of 15.2 m^3/day (EFH, Table 1-2)
				2,765	Resident child	Assuming 1-5 year old rate of 7.55 m^3/day (EFH, Table 5-23)
				4,991	Adult/child Resident	Age-averaged exposure assuming 24 years as adult + 6 years as child.
				7,300	On-site worker	Assuming RAGS default rate of 20 m^3/day for workers
				7,300	Construction worker	Assuming RAGS default rate of 20 m^3/day for workers; differs from the RESRAD Build inhalation due to the different activities between the two construction workers; RESRAD Build construction worker is a renovation/demolition scenario
				5,110	Juvenile Trespasser	Avg. for 7-16 year old male of 14 m^3/day (EFH, Table 5-23)
Mass loading for inhalation	g/m^3	0.0001	5	Use default	Non-construction	RESRAD default used
				6.00E-04	Construction	DCH Section 35
Exposure duration	yr	30	7	Site-specific	All receptors	Same as ED in standard RAGS equations
				30	Resident adult	Duration for resident (EFH, RAGS)
				6	Resident child	Assuming 6 years of childhood spent at site
				25	On-site worker	Duration for occupational receptor (EFH, RAGS)
				1	Construction worker	Assuming construction activities during one calendar year
				10	Juvenile Trespasser	Assumed for off-site adolescent receptor through ages 7-16
Shielding factor, inhalation	unitless	0.4	6	Use default	All receptors	Fraction of outdoor air that is filtered/diluted; 1.0 = no filtering/dilution; RESRAD default used
Shielding factor, external gamma	unitless	0.7	4	Use default	All receptors	Fraction of outdoor gamma that is shielded; 1.0 = no shielding; RESRAD default used
				0.4	Building occupant	SSG Section 2; 60% shielding for all indoor receptors
Fraction of time spent indoors	unitless	0.5	5	Site-specific	All receptors	Fraction of 8,760 hours spent indoors on-site
				0.655	Resident adult	16.4 hr/day for 350 days/yr for resident (EFH, Table 1-2)
				0.655	Resident child	16.4 hr/day for 350 days/yr for resident (EFH, Table 1-2)
				0.20	On-site worker	7 of 8 hours per day for 250 days per year (assumed)
				0.0	All other receptors	No indoor exposure
Fraction of time spent outdoors (on site)	unitless	0.25	5	Site-specific	All receptors	Fraction of 8,760 hours spent outdoors on-site
				0.0799	Resident adult	2 hrs/day for 350 days/yr for resident (EFH, Table 1-2)
				0.223	Resident child	5 hrs/day on weekdays or 7 hrs/day on weekends for 350 days per year for children
						ages 1-11 (EFH, Table 1-2)
				0.0285	On-site worker	1 of 8 hrs/day for 250 days/yr (assumed)
				0.228	Construction worker	Assumes one full work-year for a supervisor-type worker
				0.011	Juvenile Trespasser	Assumes 4 hr/wk averaged over 24 wks/yr (1 day/week for 6 months).
Shape factor flag, external gamma	unitless	1.0	-	Use default	All receptors	Default = uniform circular
Fruits, vegetables and grain consumption	kg/yr	160	2	Use default	Gardening	RESRAD default used

TABLE 6-4
RECEPTOR-SPECIFIC AND SCENARIO-SPECIFIC RESRAD PARAMETER VALUES
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

RESRAD Parameter	Units	RESRAD Default	Risk Variability[a]	Proposed Values[b]	Receptor or Scenario	Comment/Reference
				469	Resident adult	22.4 g/kg-day (12.4 for fruit and 10 for vegetables) minus leafy vegetable rate for 60
						kg adult; 60 kg used because intake rate data includes child data (EFH, Table 1-2)
				118	Resident child	22.4 g/kg-day (12.4 for fruit and 10 for vegetables) minus leafy vegetable rate for 15
						kg child (EFH, Table 1-2)
				N/C	All other receptors	Not used
Leafy vegetable consumption	kg/yr	14	5	Site-specific	Gardening	Average over entire 365-day year; (EFH Volume III)
				21.4	Resident adult	NUREG/CR-5512 Volume 4 default for resident farmer
				4.59	Resident child	Adult value scaled by child-to-adult body weight factor
				N/C	All other receptors	Not used
Soil ingestion rate	g/yr	36.5	4	Site-specific	All receptors	Average over entire 365-day year; default equivalent to 100 mg/day
				36.5	Resident adult	100 mg/day for residential adult (RAGS)
				73.0	Resident child	200 mg/day for residential child (RAGS)
				43.8	Adult/child Resident	Age-averaged exposure assuming 24 years as adult + 6 years as child.
				18.25	On-site worker	50 mg/day for industrial worker rate (RAGS)
				120.5	Construction worker	330 mg/day for assuming outdoor summer activities (EPA 2002, Exhibit 5-2)
				54.75	Juvenile Trespasser	150 mg/day assuming average of adult and child rates (RAGS)
Drinking water intake	L/yr	510	3	Site-specific	All receptors	Average over entire 365-day year; default equivalent to 1.397 L/day
				869	Resident adult	34 ml/kg-day for 70 kg adult (EFH, Table 1-2)
				186	Resident child	34 ml/kg-day for 15 kg child (EFH, Table 1-2)
				73	Construction worker	Based on an assumed incidental ingestion rate of 0.2 L/day
				N/C	All other receptors	Typically limited to above residential or farming scenarios
Contamination fraction of drinking water	unitless	1.0	-	1.0	All receptors	Typically set to 1.0; Manual Appendix E
Contamination fraction of irrigation water	unitless	1.0	-	1.0	Gardening	Assumes that home gardens are irrigated
Contamination fraction of plant food	unitless	-1[g]	-	0.05	Gardening	Typical for small suburban garden.
Mass loading for foliar deposition	g/m^3	0.0001	7	0.0001	Gardening	Used Manual Appendix E
Depth of soil mixing layer	m	0.15	5	0.15	All receptors	Relevant when contaminated thickness < 0. 15 m or cover thickness < 15 cm (original cover can erode to < 15 cm); default assumes tilling
Depth of roots	m	0.9	3	Use default	Gardening	RESRAD default used
Drinking water fraction from ground water	unitless	1.0	-	1.0	All receptors	Default assume 0% from surface water; set to 0.0 for 100% from surface water
Household water fraction from ground water	unitless	1.0	-	1.0	Resident only	Default assume 0% from surface water; set to 0.0 for 100% from surface water
Irrigation fraction from ground water	unitless	1.0	-	1.0	Gardening	Assumes that home gardens are not irrigated.
Wet weight crop yield for non-leafy	kg/m^2	0.7	5	Use default	Gardening	RESRAD default used
Wet weight crop yield for leafy	kg/m^2	1.5	7	Use default	Gardening	RESRAD default used
Wet weight crop yield for fodder	kg/m^2	1.1	7	Not Used	Gardening	Not used
Growing season for non-leafy	years	0.17	7	Use default	Gardening	RESRAD default used
Growing season for leafy	years	0.25	7	Use default	Gardening	RESRAD default used
Growing season for fodder	years	0.08	7	Not Used	Gardening	Not used
Translocation factor for non-leafy	unitless	0.1	7	Use default	Gardening	RESRAD default used
Translocation factor for leafy	unitless	1.0	7	Use default	Gardening	RESRAD default used
Translocation factor for fodder	unitless	0.1	7	Not Used	Gardening	Not used
Dry foliar interception fraction for non-leafy	unitless	0.25	7	Use default	Gardening	RESRAD default used
Dry foliar interception fraction for leafy	unitless	0.25	7	Use default	Gardening	RESRAD default used

TABLE 6-4
RECEPTOR-SPECIFIC AND SCENARIO-SPECIFIC RESRAD PARAMETER VALUES
REMEDIAL INVESTIGATION FORMER GUTERL SPECIALTY STEEL CORPORATION FUSRAP SITE

RESRAD Parameter	Units	RESRAD Default	Risk Variability[a]	Proposed Values[b]	Receptor or Scenario	Comment/Reference
Dry foliar interception fraction for fodder	unitless	0.25	7	Not Used	Gardening	Not used
Wet foliar interception fraction for leafy	unitless	0.25	7	Use default	Gardening	RESRAD default used
Wet foliar interception fraction for non-leafy	unitless	0.25	6	Use default	Gardening	RESRAD default used
Wet foliar interception fraction for fodder	unitless	0.25	7	Not Used	Gardening	Not used
Weathering removal constant for vegetation	1/yr	20	6	Use default	Gardening	RESRAD default used
Storage time: fruits, non-leafy vegetables, and grain	days	14	7	Use default	Gardening	RESRAD default used
Storage time: leafy vegetables	days	1.0	7	Use default	Gardening	RESRAD default used
Storage time: well water	days	1.0	7	Use default	Gardening	RESRAD default used
Storage time: surface water	days	1.0	7	Use default	Gardening	RESRAD default used
Pathway - external gamma	unitless	active	-	Active	All receptors	See Manual Appendix A
Pathway - inhalation (w/o radon)	unitless	active	-	Active	All receptors	See Manual Appendix B
Pathway - plant ingestion	unitless	active	-	Active	Gardening	See Manual Appendix D
				Inactive	All other receptors	Typically active for resident or subsistence farmer only
Pathway - drinking water	unitless	active	-	Active	Resident	See Manual Appendix E
				Inactive	All other receptors	Typically active for resident or subsistence farmer only
Pathway - soil ingestion	unitless	active	-	Active	All receptors	See Manual Appendix F

[a] From NUREG/CR-6697 Table 4.1; represents variability of radiological dose (same relationship with risk assumed) on parameter ranging from 1 (extremely sensitive) to 7 (insensitive). Dash (-) shown if no values listed in NUREG/CR-6697.

[b] Site-specific information/data (either physical, behavioral or metabolic) should be used whenever available. For this table, general information is provided in the Comment/Reference column when the Proposed Values is "site-specific."

[c] From Olhoeft, G.R. and Johnson, G.R., 1989. Densities of rocks and minerals. In: Carmichael, R.S., ed., Practical Handbook of Physical Properties of rocks and Minerals. CRC Press, Boca Raton, p. 141-176, as cited in: Dorsch, J. 1997. Effective Porosity and Density of Carbonate Rocks (Maynardvile Limestone and Copper Ridge Dolomite) within Bear Creek Valley on the Oak Ridge Reservation Based on Modern Petrophysical Techniques. ORNL/GWPO-026, Figure 5.

[d] The unsaturated zone may contain as many as four layers, including fill, reworked fill and native soil, reworked native soil, and native soil.

[e] Radionuclide-specific and can be soil-type-specific. See RESRAD support documentation for potential defaults.

[f] Values based on laboratory results. The value to use will depend on the modeled path.
(1) For unsaturated zone flow in native, uncontaminated soil, 70 mL/gm will be used.
(2) For unsaturated zone flow in contaminated soil/fill, 38.53 mL/gm (average of three samples) will be used.
(3) For saturated flow (bedrock), 0.22 mL/gm will be used.

[g] Adjusted automatically by RESRAD based on the contaminated surface area.

Notes:
Dose and Risk from Appendix V tables. Hazard Index from Table 6-14.
Bolded values exceed the target dose of 25mremr/yr, the target risk of 1x 10 $^{-4}$, or the target hazard index of 1.
Soil is surface soil for juvenile trespasser and on-site worker and total soil forconstruction worker and resident receptors.
EU = Exposure Unit
mremr/yr = millirem per year
-- = Media was not sampled or doesn't exist in this exposure unit.
NA = Not applicable; the receptor is assumed to not be exposed to this media.
NC = Not Calculated; this calculation is not performed for this receptor at this year.

1.0 INTRODUCTION

CB&I Federal Services LLC (CB&I), working under contract with the United States Army Corps of Engineers (USACE), Buffalo District Contract Number W912QR-08-D-0013, Delivery Order No. DN03, CB&I Project Number 140416 has prepared this Groundwater Modeling Report for the former Guterl Specialty Steel Corporation Site (Guterl Site or Site) (previously known as the Simonds Saw and Steel Company [Simonds]). The processing of natural uranium metal at the Guterl Site resulted in dust, mill shavings, and associated land disposal that contaminated on-site soils and facility buildings. The contaminated soils act as potential sources of the uranium-impacted groundwater. Groundwater in the shallow, as well as deep, bedrock underlying the Guterl Site has been documented to be impacted with uranium, as described in the Remedial Investigation (RI) Report prepared by Earth Tech/AECOM Inc. for the USACE (2010), the data obtained during subsequent data gap investigation (DGI) performed by Shaw Environmental & Infrastructure, Inc. (Shaw) (USACE, 2012a, b), and supplemental sampling performed by Shaw (USACE, 2013).

Modeling of the fate and transport of uranium in soil and groundwater was conducted first by CB&I and later the USACE. Numerical models were utilized due to the complexity of evaluating the remedial alternatives and their long-term effectiveness in the soil and groundwater in the underlying fractured bedrock. The numerical models provide a comprehensive tool for fate and transport analysis in the soil and the groundwater media.

The USACE updated the modeling analyses and remedial alternatives to focus on a set of technologies that are most implementable at the Guterl Site, specifically the monitored natural attenuation and/or hydraulic control of the uranium plume under two soil (or source) removal alternatives.

1.1 Modeling Purpose and Objectives

The primary objectives of the numerical modeling were to:

- Determine the fate and future extent of uranium plumes in shallow and deep groundwater when subjected to the various groundwater remedial alternatives.
- Determine the effectiveness of an individual remedial alternative in meeting the remedial action objectives (RAOs) identified in the Feasibility Study (FS).
- Quantify the timeframes necessary to meet the RAOs.
- Serve as a decision-making tool for comparative evaluation of remedial alternatives in the FS.

The Guterl Site-specific RAOs presented in the FS include the following that are relevant to the modeling:

- Prevent exposure to uranium and ^{232}Th in soil and buildings; and uranium in groundwater; such that a construction worker does not receive a total effective dose exceeding 25 mrem/yr above background from all pathways.
- Comply with the Maximum Contaminant Level (MCL) of 30 µg/L in groundwater that is a potential source of drinking water.

The Guterl site contains an inactive hazardous waste site (landfill) that is the responsibility of the New York State Department of Environmental Conservation (NYSDEC). Landfill site number 932032 in the NYSDEC inactive landfill database contains Atomic Energy Commission (AEC)-related constituents that do not qualify for remediation under Formerly Utilized Sites Remedial Action Program (FUSRAP) due to responsible party policy (i.e., the Federal Government did not request relocation of waste). However, to create a holistic set of site alternatives, the orphaned AEC-related waste is included in the model to optimize the remedial schedules and decisions associated with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA – 42 U.S.C §1906 et seq.).

1.2 Scope of Work

The scope of the computer modeling included the following:

- Develop a soil leaching model to determine the future impacts to groundwater resulting from the uranium in the soils.
- Develop a flow model incorporating on- and off-site groundwater flow.
- Develop a solute transport model for uranium in groundwater.
- Perform a detailed analysis of the groundwater remediation alternatives using the models.

Computer model input data were derived mainly from existing site data and reports, including the RI Report (USACE 2010), the DGI performed by Shaw (USACE 2012a, b), and supplemental sampling performed by Shaw (USACE 2013).

1.3 Organization

The modeling report is organized as follows:

- *Section 1.0 – Introduction*: provides the purpose, scope, and organization of this report.
- *Section 2.0 – Site Setting*: summarizes site background information from previous investigations and results.

- *Section 3.0 – Conceptual Site Model and Assumptions*: presents a conceptual model of groundwater flow and contaminant migration pathways along with assumptions used for modeling.
- *Section 4.0 – Model Code Selection:* describes the model code selection procedure for each aspect of the fate and transport modeling.
- *Section 5.0 – Soil Leaching Model:* presents the development of soil-to-groundwater uranium leaching model for two preliminary remediation goals (PRGs) for soil:
    - Construction worker dose limit PRG (CW-PRG).
    - Protection of groundwater resources PRG (GW-PRG).
- *Section 6.0 – Groundwater Flow Model:* presents the development of 3-dimensional (3-D) groundwater flow model, including details of model input parameters, setup, and calibration to an appropriate and comprehensive groundwater elevation dataset.
- *Section 7.0 – Remedial Alternatives Model:* presents an evaluation of groundwater remedial alternatives using the uranium transport model. Remedial alternatives evaluated include:
    - No action
    - Monitored natural attenuation (MNA) for both the CW-PRG and GW-PRG.
    - Groundwater recovery using vertical wells and a rubblized trench for both the CW-PRG and GW-PRG.
- *Section 8.0 – Conclusions:* provides the conclusions for this modeling report.
- *Section 9.0 – References:* lists the applicable references cited in this modeling report.
- *Attachment A:* Uranium Trend Analysis
- *Attachment B:* In situ Transducer Data Graphs
- *Attachment C:* Calculation of Groundwater Flux to the Erie Canal
- *Attachment D-1 to D-5:* SESOIL Modeling results for the no-action alternative
- *Attachment E-1 to E-5:* SESOIL Modeling results for the GW-PRG
- *Attachment F-1 to F-5:* SESOIL Modeling results for the CW-PRG
- *Attachment G:* SESOIL Modeling files (CD)
- *Attachment H:* Numerical Modeling files (CD)

2.0 SITE SETTING

An overview of the site setting related to developing the soil leaching, groundwater flow, and uranium transport numerical model is described in the following sections.

2.1 Site Location

The Guterl Site is located in the City of Lockport, New York, approximately 32 kilometers (km) (20 miles) northeast of Buffalo, New York. The approximately 28-hectare (ha) (70-acre [ac]) site is bordered by Ohio Street on the south and east, residential and commercial properties to the north, and New York State Route 93 on the west. The Erie Canal is south-southeast of the Guterl Site boundary (Figure 1-1).

The model area-of-interest consists of the following on-site and off-site delineated on Figure 1-1:

- The 24.5-ha (60.6-ac) ATI Specialty Materials (formerly Allegheny Ludlum Corporation) property, which includes four buildings that were constructed after the termination of Atomic Energy Commission (AEC) activities. This area includes a 3.5-ha (8.6-ac) inactive hazardous waste disposal site owned by ATI Specialty Materials, located in the northwest corner of the Site. This area is a New York State Department of Environmental Conservation (NYSDEC) inactive hazardous waste disposal site (NYSDEC 2003) that will be addressed under FUSRAP to achieve a holistic site remedy for groundwater.

- The 3.6-ha (9-ac) excised property (also known as the "Excised Area") located in the southeast corner of the Site and owned by Guterl Specialty Steel; this area includes nine buildings that existed during the AEC activities.

Off-site areas of interest include 1) the area between the southern property boundary and the Erie Canal and 2) the dolostone quarry area to the east. These areas would receive groundwater flow originating from the Site.

2.2 Background

From 1910 to 1966, the Guterl Site was owned and operated by Simonds to manufacture steel and specialty steel alloys (high-alloy) used in the production of saws and other tools. During World War I and World War II, normal plant operations were suspended and production focused on the armor plating for the U.S. Government under various contracts.

From 1948 to 1956, Simonds performed rolling mill operations on uranium (U) metal and to a much smaller extent, thorium (Th) metal. The U and Th metal operations from 1948 to 1952 were performed under contracts with the New York Operations Office of the AEC (predecessor

to the Nuclear Regulatory Commission). Simonds continued the work from 1952 to 1956 under a subcontract to National Lead of Ohio (NLO). During operations from 1948 through 1956, the AEC was responsible for providing radiological monitoring, safety guidance and assistance, and residue control from the manufacturing operations (residues were returned to the AEC or NLO).

In 1966, Simonds was acquired by the Wallace-Murray Corporation (Delaware Secretary of State 1966). The Wallace-Murray Corporation continued to operate the plant as a specialty steel mill until 1978, when Guterl Specialty Steel Corporation acquired the property (Niagara County Clerk's Department 1978).

In 1982, Guterl Specialty Steel Corporation filed for Chapter 11 bankruptcy protection in the U.S. Bankruptcy Court for the Western District of Pennsylvania (this was changed to a Chapter 7 bankruptcy in 1990). In 1984, using industrial development bonds received through the Niagara County Industrial Development Agency, the Allegheny Ludlum Corporation purchased Guterl Specialty Steel Corporation assets at an auction (U.S. Bankruptcy Court 1984). In 1996, the Allegheny Ludlum Corporation merged with Teledyne Incorporated to form Alleghany Technologies Incorporated (ATI). The Guterl Site, with the exception of the Excised Area, is currently owned and operated by ATI under the name ATI Specialty Materials. ATI currently operates a steel-making and milling facility on the majority of the Site.

The USACE performed a historical aerial photo analysis (USACE 2009) that indicates the inactive hazardous waste disposal site in the northwestern portion of the site became an uncontrolled storage area for site-generated wastes between 1951 and 1958. The waste volume in this area grew between 1958 and 1963, apparently from waste and soil deposition due to site preparation for plant expansion on the western portion of the property. In 1966, the inactive hazardous waste disposal site was much larger and may have accumulated material from other portions of the site during western plant expansion and associated railroad-spur construction for the combined plants. By 1972, the inactive hazardous waste disposal site was approximately the size reflected in 2016, with some minor expansion to the west in 1978.

The 1995 aerial photo indicates the previous western expansion appears reconsolidated eastward to reflect a more rectilinear footprint and waste distribution within the property boundaries, as seen in 2016. These photographic data indicate that AEC-related contamination in the northern portion of the property was partly moved into the inactive hazardous waste disposal site area after AEC-related operations ceased at Guterl. Irrespective of placement, the USACE includes this radioactive residue in the remedial alternative analyses.

2.3 Climatology and Meteorology

The Guterl Site is located in Niagara County, NY, which has a humid, continental-type climate. The region has warm summers with moderate humidity, whereas winters have cold temperatures

and snowfall (including lake effect snow). Niagara County receives an average of 88.6 centimeters (cm) (34.9 inches) of precipitation, including 171.5 cm (67.5 inches) of snowfall per year. Generally, precipitation is distributed evenly throughout the year, although minimum monthly precipitation values are slightly lower during winter.

2.4 Physiography

The topography at the Guterl Site is relatively flat, with a gentle southward slope of approximately 4.7 meters (m) per km [25 feet (ft) per mile] as measured from the north side of the Guterl Site at Route 31 (elevation 189 m [620 ft]) to the south side of the Guterl Site at New York State Route 93 (elevation 181 m [595 ft]).

2.5 Surface Water Hydrology

The Guterl Site does not contain surface water bodies such as ponds or streams; there are no visible surface drainages that connect the Site to the Erie Canal located south-southeast of the Site. Temporary surface water has been observed to occur at the Guterl Site as storm water runoff and ponding from generally undeveloped storm water drainage patterns. Storm-water runoff is observed to move as sheet flow from topographic highs to topographic lows. Areas of standing water are seasonally influenced and are subject to evaporation or infiltration.

The Erie Canal is located approximately 90 m (300 ft) south-southeast of the Guterl Site boundary (Figure 1-1). The surface water elevation of the Erie Canal immediately south of the Guterl Site fluctuates by several feet due to seasonal control of the navigable water level (i.e., water elevation is lowered in winter and raised in summer). The levels are influenced also by the nearby Lockport Locks to the northeast and stages in the Tonawanda Creek to the southwest (Tonawanda Creek provides the headwaters for the Erie Canal).

The normal navigational season extends from April through mid-November, so the water elevation in the Erie Canal is 172.4 m (565.7 ft) above mean sea level (msl) as determined from the gauge reading at Lock 35, which is located approximately 2.82 km (1.75 miles) downstream of the Guterl Site. The canal bottom is 3.0 to 3.7 m (10 to 12 feet) below the water surface, at elevation 169.4 to 168.8 m (555.7 to 553.7 ft) above msl. From mid-November through April, the canal is not navigable and has an average water depth of 0.6 m (2 ft) (Rick Manns, Erie Canal Corp., Telecommunication, September 2011).

In the area of the Guterl Site, the Erie Canal flows from west to east (i.e., from the Niagara River toward Lockport). From April 20 through November 20 the average flow is 0.6 m (2 ft) per second. From November 20 through April 20, the lower Erie Canal is dewatered (below the Lockport Locks between the bulkhead in Pendleton, NY, and the Genesee River) and there is no measurable flow. As a result, the flow from the west (i.e., in the area of the Guterl Site) through the Lockport Locks is also negligible.

2.6 Geology

The subsurface lithology beneath the Guterl Site consists of unconsolidated soil and shallow weathered bedrock that is underlain by fractured dolomite, with the degree of fracturing decreasing with depth. The dolomite grades into shaly (argillaceous) dolomite and eventually is underlain by a shale bedrock unit.

The general hydrostratigraphy underlying the Site, starting from ground surface, is summarized as follows:

- Overburden soil
- Shallow weathered bedrock (shallow groundwater)
- Competent dolostone (no monitoring wells installed)
- First main fracture zone (deep groundwater)
- Shaly dolostone (no monitoring wells installed)
- Rochester Shale (no monitoring wells installed)

The unconsolidated soil derived from glacio-lacustrine deposits, glacial till, and fill material includes native silts and clays with varying amounts of sand and bedrock fragments, which are less permeable than fill material mixed with the native soils. The overburden is 4 to 5 m (13 to 15 ft) thick in the western area of the property and a location north of the north fence. The overburden is less than 1.5 m (5 ft) thick across the remainder of the Guterl Site area.

The shallow weathered bedrock contains numerous horizontal fractures in of the top 6 to 7.6 m (20 to 25 ft) of the dolostone rock that underlies the overburden; vertical and angled fractures were also identified. Many of the fractures were noted to be weathered (e.g., have smooth surfaces). Vugs, calcite-filled vugs, and voids were also found generally in the upper 7.6 to 9.1 m (25 to 30 ft) of bedrock.

The weathered dolostone zone is underlain by less fractured rock that exhibits higher rock quality designation (RQD), which is a rough measure of the degree of jointing or fracture in a rock mass. A RQD value of 80 percent was used to demarcate the boundary between the shallow weathered dolostone and the less fractured dolostone, which occurs at 7.6 to 9.1 m (25 to 30 ft) below ground surface (bgs). The less fractured dolostone (80% < RQD) extends to approximately 19.8 m (65 ft) bgs, but contains a thin permeable zone of horizontal bedding planes from about 10 to 10.7 m (33 to 35 ft) bgs. This discrete zone is considered the deep water bearing unit, or first main fracture zone, that has an overall fracture density that is less than the shallow weathered bedrock water-bearing zone.

Dark gray shaly dolostone was encountered at depths of approximately 18.2 to 19.8 m (60 to 65 ft) bgs. This shaly (or argillaceous) dolostone appears to be a transition deposit that grades into the underlying Rochester Shale Formation that is evident around 24.4 m (80 ft) in depth bgs.

Geologic cross-sections were constructed using subsurface information from well installations on the Guterl Site. The cross-section shown on Figure 2-1 extends from the northwest corner of the Guterl Site across the site boundary to the Erie Canal (northwest to southeast traverse).

A fracture trace analysis was conducted at the Guterl Site and surrounding area by the Army Geospatial Center (AGC) to support characterization of surficial terrain features that may influence pathways for contaminant flow. The AGC report, completed in March 2010 and included in Appendix K of the Final DGI Tech Memo (USACE, 2012b), presents linear features discovered by examination of aerial photographs using imagery at a scale of 1:20,000. Results of the AGC analysis are shown in rose diagrams presented for study areas covering a 0.8-km (0.5-mile) and a 1.6-km (1-mile) radius from the Guterl Site. The 0.8-km (0.5-mile) radius study area rose diagram shows that a majority of fractures are oriented northwest-southeast (i.e., a dip set) and a lesser amount is oriented east-northeast/west-southwest (i.e., a strike set). The 1.6-km (1-mile) radius study area diagram indicates similar orientations with the northwest-southeast and east-northeast/west-southwest components approximately equal.

A view of the fracture trace lineaments found in the Guterl Site area show a general northwest-southeast fracture trace orientation pattern north of the Erie Canal and a general northeast-southwest orientation south of the Canal. Larger scale lineaments can be observed and are correlated with a northwest-southeast re-entrant on the Niagara Escarpment that leads directly across the Guterl Site. This larger scale fracture set appears to be influencing groundwater flow and uranium transport towards the Erie Canal, as discussed in Sections 2.7 and 3.1.2.

2.7 Hydrogeology

Groundwater at the Guterl Site and surrounding areas flows within overburden and bedrock formations. Groundwater flows through the shallow weathered bedrock (shallow groundwater) and in the first main fracture zone (deep groundwater) before discharging to the Erie Canal. The possibility of significant groundwater flow under the Canal bottom or vertically into the deeper dolostone and shaly dolostone units is low, as exemplified by the sparseness of fracture zones in deep rock cores (>24 m or >80 ft) and the significant decrease (about ten-fold) in uranium concentrations between the shallow and deeper water-bearing zones (i.e., vertical transport is limited).

The groundwater table is fairly shallow and is encountered at depths ranging from 1 m (3 ft) bgs to 3.2 m (10.5 ft) bgs. The shallow bedrock potentiometric surface map shows a generally south to southeasterly flow direction, with the highest groundwater elevations in the northern area of

the Guterl Site (Figure 2-2). A groundwater divide oriented northwest to southeast that originates in the northwestern area of the Site is apparent. West of the divide, the groundwater flow direction is towards the quarry due to operational dewatering in the quarry. South and east of the divide, groundwater flow is to the southeast towards the Erie Canal.

Deep groundwater wells are installed in the first main fracture zone and exhibit water levels that range from 1.0 to 10.8 m (3.3 to 35.4 ft) bgs; these levels are more variable than in the shallow bedrock. The deep groundwater shows a similar pattern to the shallow groundwater with an apparent general groundwater flow direction to the southeast towards the Canal and a westerly groundwater flow component towards the quarry. These combined datasets indicate that the northwest to southeast fracture set (dip set) that appears crossing the site provides some preferential hydraulic control or pathway in the subsurface. This is exemplified by the minimal southwesterly dispersion of the plume towards the quarry, along with seeps and ice falls that indicate preferential discharge from the rock exposed in the Erie Canal.

Vertical hydraulic gradients between the shallow and deep groundwater exist at some locations; at most locations the gradients show a slight downward flow component or are near coincident (magnitude less than 0.003 m/m (0.01 ft/ft) is considered near coincident).

Hydraulic conductivity values obtained for the shallow bedrock wells range from 8.5×10^{-6} cm/sec (0.024 ft/day) at MW-705D to 7.7×10^{-2} cm/sec (218 ft/day) at MW-3. Hydraulic conductivity values obtained for the deep bedrock wells range from 3.2×10^{-7} cm/sec (0.0009 ft/day) at MW-711DD to 1.5×10^{-2} (41.4 ft/day) at MW-712DD. The geometric mean hydraulic conductivities for shallow and deep wells are 3.5×10^{-3} cm/sec and 3.5×10^{-4} cm/sec (10 ft/day and 1 ft/day), respectively. An evaluation of the measured hydraulic conductivity values for the overburden and the shallow bedrock (see USACE 2012b, Figures 4-14 and 4-15) indicates the lack of trends or patterns in the distributions of hydraulic conductivities across the modeled area. However, the USACE expects the larger fracture set that crosses the site to have higher permeability, which was rendered in the groundwater flow model, as discussed in Section 3.

3.0 CONCEPTUAL SITE MODEL AND ASSUMPTIONS

3.1 Conceptual Model

Site characterization data collected during the RI and the DGI were used to develop a revised conceptual site model (CSM) of the Guterl Site, as presented on Figure 3-1. The CSM is a non-numeric model that consolidates the geologic, hydrologic, analytical, and surface-water data into a unified interpretation of site conditions.

3.1.1 Groundwater Flow

The CSM shows that a portion of the precipitation that falls as rain and snow infiltrates into the ground and recharges the groundwater system before discharging primarily into the Erie Canal; secondary discharge areas include the quarry and possibly the deeper dolostone overlying the Rochester Shale Formation. The remainder of the precipitation is lost to the atmosphere through the processes of evaporation and transpiration through vegetation, or is directed as surface water runoff towards the Erie Canal.

Seeps have been observed along the northern rock face of the Erie Canal at elevations greater than the base of the shallow weathered bedrock zone, indicating that groundwater from the shallow weathered bedrock is discharging to the surface as seeps. From mid-November through April, the Canal is not navigable since water elevations are 3 to 3.7 m (10 to 12 ft) lower than the navigable elevations maintained from May through mid-November. During the winter period, ice falls can be seen along the canal walls, most emphatically where the seeps are observed in the summer, which appear coincident with the lineament-aligned fracture set that crosses the site.

Groundwater elevation data, the associated flow directions, and the elevation of the first fracture zone together indicate that the deep water-bearing zone also discharges to the Erie Canal. Potential pathways underneath the Canal bottom, or possibly vertically into the deeper shaly dolostone unit have not been determined. However, based on the observed decrease in fracture density with depth (USACE 2010, 2011), which corresponds to a decrease in hydraulic conductivity and transmissivity of the bedrock, along with lower uranium concentrations with depth, site-related uranium impacts are not expected to exceed drinking water standards in the lower shaly dolostone or deeper bedrock units.

3.1.2 Uranium Migration

The processing of natural uranium metal at the Guterl Site resulted in dust, mill shavings, acid-bath fluids, and associated land disposal that contaminated on-site soils and facility buildings; these are the potential sources of the uranium-impacted groundwater. Uranium subsequently leached into groundwater and developed the plume observed below the Site. Uranium transport from the Site involves two major mechanisms:

- Leaching of uranium from contaminated fill and native soils to groundwater
- Groundwater transport of dissolved uranium

It is expected that the residual uranium in soil will continue to act as a source to the groundwater plume for a long time (hundreds of years) as the infiltration of precipitation recharges the groundwater. Groundwater in the shallow, as well as deep, wells within the dolostone is documented to be impacted with uranium.

Uranium contamination at the Site is typically present as uranium dioxide (UO_2) or triuranium octoxide (U_3O_8) in soils; UO_2 slowly converts to U_3O_8 at ambient air temperatures (Argonne National Laboratory [ANL], undated). Uranium in UO_2 is present in the reduced, tetravalent (U^{4+}) form, which has exceedingly low solubility in water (approximately 1×10^{-26} µg/L at pH 7). Uranium in the oxidized U_3O_8 state is present as both U^{4+} and U^{6+} valence states; this is written stochastically as $(2U^{6+})U^{4+}O_8$. U_3O_8 also is known for low solubility in water, yet can vary with redox-sensitive species (e.g., iron and manganese), pH, calcium carbonate concentrations, and humic substances. Aqueous chemistry variations can increase the U^{6+} solubility more readily than U^{4+} and produce uranium concentrations that exceed the MCL of 30 µg/L. Carbonate ions, in particular, form complexes with uranium that increase its solubility and mobility. Since the Lockport Dolostone is a $CaMgCO_3$ (Calcium Magnesium Carbonate) based Silurian bedrock, oxidized uranium will speciate into mobile (anionic) uranyl-carbonate in the aquifer (USACE 2010, Kumar 2011, Frederick et al. 2012, Frederick et al. 2015).

Annual groundwater sampling conducted since 2009 produced results consistent with previous RI sampling, which shows natural isotopic signatures occur in a mostly dissolved state. Detailed analysis presented in the Final DGI Tech Memo (USACE, 2012b) confirmed that the uranium isotope ratios are consistent with naturally occurring uranium (^{234}U and ^{238}U are present at equal concentrations by activity), indicating the uranium processed at the site was neither enriched nor depleted. Comparison of filtered and unfiltered total uranium results from the DGI samples indicates most of the uranium present is dissolved; approximately 98 percent of the total uranium was in the dissolved form in the samples collected (i.e., the uranium ratio between field filtered (0.45 micron) and unfiltered samples is 0.98) (Frederick et al. 2012).

The mobility of uranium in groundwater is most sensitive to pH, redox conditions, and the concentrations of carbonate, which is a strong complexing agent for the U^{6+} form of uranium. Geochemical conditions in the aquifer indicate total uranium will remain in a soluble form at all locations investigated. Natural redox conditions do not favor uranium precipitation (USACE, 2012b).

The on-site uranium plume exhibits a steady-state condition, with only one monitoring well within the plume showing an upward trend. The monitoring well, MW-24, had a significant

upward trend with concentrations that increased from 5.49 to 35.08 µg/L in the four successive samples during the DGI (USACE, 2012b). Since 2007, 30 wells that have been sampled four or more times, so a re-calculation of the Mann-Kendall trends was performed to determine if the uranium concentrations are stable, increasing, or decreasing (Attachment A). The results indicate the following:

- 12 monitoring wells show Increasing or Probably Increasing Trends (23%),
- 32 monitoring wells show Stable or No Trends (62%), and
- 8 monitoring wells show Decreasing or Probably Decreasing Trends (15%).

The figures in Attachment A show the spatial distribution of the uranium trends. The shallow groundwater shows a Stable plume over the last 9 years, with minor lateral dispersion (seen as increasing trends) along the eastern and western periphery of the plume. This normal mechanism was predicted in the groundwater model. The deep groundwater plume is Stable and exemplifies only one well of 12 with an increasing trend (MW-711DD near the Erie Canal). The highest uranium concentrations were detected in groundwater near the center of the Guterl Site.

The uranium plume centerline appears to trend in a northwest to southeast direction across the Guterl Site, which coincides with the regional fractures detected in the area and reported in the RI Report. A significant portion of the uranium-impacted water discharges to the Canal, while the remainder appears to be directed towards the deep water-bearing zone, as is postulated by the much lower concentrations in the deeper zone. Figure 3-2 shows the relationship between total uranium plumes in the shallow and deep groundwater to the presence of uranium in the overlying unsaturated soil.

The uranium plumes are defined by the total groundwater uranium concentrations exceeding the 30 µg/L MCL. Five general soil areas exhibit uranium concentrations sufficiently high to act as potential sources of uranium to the underlying groundwater. Infiltration from precipitation leaches a fraction of the soil-based uranium, which has created a uranium plume in the shallow groundwater that is approximately 15.7 ha (38.7 ac) in area. Due to vertical hydraulic gradients in portions of the Guterl Site, a fraction of the uranium mass is being gradually transferred from the shallow to the deep groundwater, possibly via the regional lineament and associated vertical fracturing. The deep groundwater plume is approximately 7.3 ha (18.0 ac) in size and exhibits concentrations that can be about an order of magnitude lower that the shallow plume.

Attachment B exhibits in situ transducer data that indicate the positive response of the shallow zone to precipitation events, where recharge through soils increase water levels and specific conductance due to the leaching of both natural metals and uranium from soils. After precipitation-based recharge subsides and water levels decline, the specific conductance declines as the groundwater disperses the dissolved solids. The transducer data also show the lag time

between the temperature responses between the shallow and deep groundwater, where a lag of three (3) months is common and provides insight to the hydraulic separation of the layers. These data indicate that MNA is an effective technology (i.e., the aquifer can disperse the plume), in combination with other GRAs (e.g., soil removal), to achieve RAOs over an extended period of time.

Attachment C presents a uranium flux analysis for the downgradient edge of the plume before it migrates off site. The calculation indicates that an average concentration that leaves the site is 25.7 µg/L total uranium.

3.2 Modeling Assumptions

The following assumptions were used for modeling the site conditions:

- Flow in the shallow and deep groundwater is analogous to equivalent porous media (EPM). The EPM approach treats the fractured rock system as if it were an unconsolidated porous medium; to best represent flow velocities common to fractured rock systems, porosity variables are reduced in the model.
- Vertical fractures (via lineament trends) within the EPM can be modeled as highly transmissive (more permeable) zones within the rock.
- A steady-state flow model is sufficient for use with a transient-state contaminant-transport model.
- The total simulation time for each of the FS alternatives will not exceed 1,000 years, which is sufficient to allow assessment of the groundwater exposure pathway(s).
- The evaluation of elemental (total) uranium will be sufficient for evaluation of groundwater impacts.
- Given that the half-life of the dominant uranium isotope ^{238}U is approximately 4.47 billion years and the modeling timeframe is 1,000 years, evaluation of radioactive decay of uranium and fate and transport of daughter products is not necessary.
- The August 3, 2011 groundwater-elevation data can be used to calibrate the flow model since this is the most complete dataset for the model domain. The DGI supplemental report evaluated potentiometric surfaces over the duration of a year, and results indicate that the dominant flow directions and gradients are consistent over the four seasons, even though the groundwater elevations change.
- There are no known groundwater extraction wells currently operating in the area that would affect the transport of uranium in the model domain, with the exception of dewatering operations at the quarry to the west of the Site. The quarry dewatering

appears to influence groundwater flow directions in the western part of the Site and was simulated using drain cells in the model.

4.0 MODEL CODE SELECTION

Code selection is an important step in modeling. It essentially consists of matching the modeling needs of the project and known hydrogeologic site conditions to the key characteristics or capabilities of existing computer codes. The selected code should possess essential characteristics or capabilities to effectively address the problem to be answered while representing known site conditions.

Computer modeling software that could accurately and efficiently simulate groundwater, the leaching of uranium from soils to groundwater, and the fate and transport of uranium in groundwater at the Guterl Site were selected. The software selected is flexible and expandable for future applications not covered by the present modeling objectives. To support the development of the preliminary remediation goal (PRG) for uranium, the vadose zone contaminant leaching model SESOIL (Bonazountas and Wagner 1984) was used to simulate the effects of residual uranium soil contamination on shallow groundwater. The groundwater modeling software package selected for application at the Guterl Site is Groundwater Modeling System (GMS) (Aquaveo 2013, version 9.0.5), a graphical user interface program that supports various flow and transport codes.

4.1 Soil to Groundwater Leaching Model Code

SESOIL is a one-dimensional vertical transport screening-level model for the vadose zone that was developed to simultaneously simulate water transport, sediment transport, and contaminant fate. The model considers seasonal hydrologic changes by using monthly climate data as a major component in the model. Other major inputs to the model are physical soil data and chemical property data, although only one chemical can be considered at a time.

The SESOIL model uses compartment geometry, where "compartments" of soil consist of cells extending from the surface through the unsaturated zone to the top of the water table. Through these cells, SESOIL runs three separate sub-models: the hydrology, sediment, and pollutant-transport cycles. The hydrologic cycle considers vertical movement only and focuses on the role of soil moisture in the soil compartments. The optional sediment cycle can include soil detachment, transport, and deposition processes at the "ground surface" of the model. The pollutant transport cycle focuses on the various chemical transport and transformation processes that may occur in the soil; this module uses calculated results from the hydrologic and sediment cycles as input. The ultimate fate and distribution of the contaminant is controlled by the processes interrelated by a mass balance equation for each soil compartment that is specified by the user. An iterative procedure is used to solve each equation.

Overall, the model is based on mass balance and equilibrium partitioning of the chemical between different phases; for example, uranium was distributed between a dissolved, pore-water phase and an adsorbed phase based on assigned solubilities and adsorption coefficients, respectively. Outputs can include time-varying constituent concentrations at different soil depths, or contaminant mass flux from the soil column through surface runoff, percolation to groundwater, volatilization, adsorption, or degradation.

The SESOIL code included in the SEVIEW© program (Schneiker 2006) was used for this modeling. This version of the model code allows an evaluation of the leaching over a period of 1,000 years, as compared to 100 years for the original version of SESOIL code.

4.2 Flow Model Code

MODFLOW was selected for modeling the groundwater flow at the Guterl Site. The software package GMS Version 9.0.5/MODFLOW-2005 was used to develop the input parameters for the groundwater flow model. GMS/MODFLOW provides computer-aided graphics to facilitate the development of the input data and visualize results. Model parameters were input and displayed on a graphical representation of the selected finite-difference grid.

MODFLOW is a modular three-dimensional groundwater flow model developed by the U.S. Geological Survey. The three-dimensional flow model assumes flow through a porous material using constant density and isothermal conditions. The following equation describes this process:

$$\frac{\partial}{\partial x_i}\left(K_{ij}\frac{\partial h}{\partial x_j}\right) - W = S_s\left(\frac{\partial h}{\partial t}\right)$$

Where:

x_i, x_j = principal coordinates of the system (i.e., x, y, and z) which are assumed to be parallel to the major axes of hydraulic conductivity (units of length [L])

K_{ij} = hydraulic conductivity tensor along the principal coordinate axes (units of length over time [L/t])

h = hydraulic head (L)

W = volumetric flux per unit volume and represents sources and/or sinks of water (units of volume per volume over time [1/t])

S_s = specific storage of the porous material (l/L)

t = time (t)

The previous equation describes groundwater flow under non-equilibrium conditions in a heterogeneous and anisotropic medium, provided the principal axes of hydraulic conductivity are aligned with the coordinate directions, in which case, the hydraulic conductivity tensor becomes:

$$K_{ij} = \begin{matrix} Kxx & 0 & 0 \\ 0 & Kyy & 0 \\ 0 & 0 & Kzz \end{matrix}$$

In general, S_s, Kxx, Kyy, and Kzz may be functions of space [$S_s = S_s(x,y,z)$, $Kxx = Kxx(x,y,z)$, etc.] and W may be a function of space and time.

The previous partial differential equation for groundwater flow is suitable for analytical solution techniques only for simple geometries and limiting assumptions. For complicated conditions, including heterogeneous and anisotropic porous media, MODFLOW applies a finite-difference numerical technique. The finite-difference method discretizes a real groundwater system into a network of blocks called "cells." The block-centered, finite-difference formulation places a "node" at the center of each cell where hydraulic heads are calculated by the code. The location of the cells and their nodes are referenced using three-dimensional (i,j,k) indices. The finite difference mesh consists of NROW rows referenced by the first index (i), NCOL columns referenced by the second index (j), and NLAY layers referenced by the third index (k).

MODFLOW provides three main solvers: (1) Strongly Implicit Procedure (SIP), (2) Slice-successive Over Relaxation (SOR), and (3) Preconditioned Conjugate Gradient 2 (PCG2).

The SIP is a method for solving a large system of simultaneous linear equations by iteration. All of the equations for the model grid are solved simultaneously. The SIP solver is very stable and generally converges to a satisfactory solution.

SOR is a method for solving large systems of linear equations by means of iteration. It is implemented in the SOR package by dividing the finite difference grid into vertical slices and grouping the node equations into discrete sets. Each set corresponds to a slice; in every iteration these sets of equations are processed in turn, resulting in a new set of estimated head values for each slice.

The PCG2 solver uses the preconditioned conjugate-gradient method to solve the simultaneous equations produced by the model. Linear and nonlinear flow models may be simulated. Convergence of the solver is determined using both the head change and residual criteria. This solver is best suited to models where certain flow cells are expected to be dewatered. A number

of shallow groundwater cells in the vicinity of the quarry are dry, so the PCG2 solver was used for modeling groundwater flow at the Guterl Site.

4.3 Uranium Transport Code

Solute transport modeling was conducted using the software package GMS/MT3DMS (Modular Three-Dimensional Transport – Multiple Species), which was developed by S. S. Papadopulos & Associates (Zheng 1990) as a multi-phase contaminant fate and transport model. MT3DMS is the most widely used and accepted solute transport model code for use with equilibrium controlled sorption or first-order chemical reactions. The model code is available in the public domain and is coupled with MODFLOW on GMS and other major groundwater modeling platforms.

MT3DMS is a model for the simulation of advection, dispersion, and chemical reactions of dissolved constituents in groundwater systems. The model program uses a modular structure similar to that implemented in MODFLOW. The MT3DMS model uses a mixed Eulerian-Lagrangian approach to the solution of the three-dimensional advective-dispersive-reactive equation in three basic options. The MT3DMS model is intended to be used in conjunction with any block-centered finite-difference flow model (e.g., MODFLOW), and is based on the assumption that changes in the concentration field will not affect the flow field measurably. MT3DMS retrieves the hydraulic heads and the various flow and sink/source terms saved by MODFLOW, automatically incorporating the specified hydrologic boundary conditions.

The partial differential equation describing three-dimensional transport of contaminants in groundwater can be written as follows:

$$\frac{\partial C}{\partial t} = \frac{\partial}{\partial x_i}\left(D_{ij} \frac{\partial C}{\partial x_i} \right) - \frac{\partial}{\partial x_i}(v_i C) + \frac{q_s}{n} C_s + \sum_{K=1}^{N} R_k$$

Where:

- C = concentration of contaminants dissolved in groundwater (units of mass over volume or length cubed [M/L^3])
- t = time (t)
- x_i, x_j = distance along the respective Cartesian coordinate axis (L)
- D_{ij} = hydrodynamic dispersion coefficient (L^2/t)
- v_i = seepage or linear pore water velocity (L/t)
- q_s = volumetric flux of water per unit volume of aquifer representing sources (positive) and sinks (negative) (1/t)
- C_s = concentration of the sources and sinks (M/L^3)

n = porosity of the porous medium (dimensionless)

R_k = chemical reaction (term (M/L^3t)

Assuming that only equilibrium-controlled linear or nonlinear sorption and first-order irreversible rate reactions are involved in the chemical reactions, the previous partial differential equation can be simplified and written as follows:

$$R\frac{\partial C}{\partial t} = \frac{\partial}{\partial x_i}\left(D_{ij}\frac{\partial C}{\partial x_j}\right) - \frac{\partial}{\partial x_i}(v_i C) + \frac{q_s}{\theta}C_s - \lambda\left(C + \frac{\rho_b}{\theta}C'\right)$$

Where:

θ = porosity (dimensionless)

ρ_b = bulk density of the porous medium (M/L^3)

C' = sorbed phase contaminant concentration (M/M)

λ = rate constant of the first-order rate reactions (1/t)

R = retardation factor (dimensionless)

The previous transport equation is linked to the flow equation through the following relationship:

$$v_i = -\frac{K_{ii}}{n} = \frac{\partial h}{\partial x_i}$$

Where:

K_{ii} = principal component of the hydraulic conductivity tensor (L/t)

h = hydraulic head (L)

The hydraulic head is obtained from the solution of the three-dimensional groundwater flow equation presented in Section 4.1.

Processes Simulated in MT3DMS

Advection: Describes the transport of miscible contaminants at the same velocity of groundwater. The advection term usually dominates for many practical problems concerning contaminant transport in groundwater. For advection-dominated problems, the solution of the transport equation is affected to some degree by two types of numerical problems: (1) numerical dispersion caused by truncation error, and (2) artificial oscillation caused by overshoot and undershoot of the solution. The mixed Eulerian-Lagrangian method implemented in the MT3DMS model is virtually free of any of these errors.

Dispersion: In porous media, dispersion refers to the spreading of contaminants over a greater region than would be predicted solely from the groundwater velocity vectors. Dispersion may result from (1) deviations of actual velocity on a micro scale from the average groundwater velocity (mechanical dispersion), and (2) molecular diffusion resulting from concentration variations (i.e., an osmotic gradient). The molecular diffusion effect is generally secondary and negligible compared to the mechanical dispersion effect, and only becomes significant when groundwater velocities are very low. The sum of the mechanical dispersion and the molecular diffusion is termed hydrodynamic dispersion.

Sinks and Sources: Sink and/or source terms in the transport equation represent solute mass dissolved in water entering the simulated domain through sources, or solute mass dissolved in water leaving the simulated domain through sinks. Model sinks or sources may be classified as "distributed" or "point input/output" features. The distributed sinks, or sources, include recharge and evapotranspiration. The point sinks, or sources, include features such as wells, drains, and rivers.

Chemical Reactions: Included in the MT3DMS model are equilibrium-controlled linear or nonlinear sorption and first-order irreversible rate equations (e.g., biodegradation and radioactive decay).

5.0 SOIL LEACHING MODEL

5.1 Approach

The leaching of uranium through unsaturated soil into the groundwater was initially evaluated during the RI using a site-wide SESOIL model; this was refined in the FS by modeling five separate soil areas that have similar physical and concentration profiles that could cause groundwater to exceed the MCL of 30 µg/L. The analyses were used to develop a PRG for the protection of groundwater, or GW-PRG (i.e., residual soil leachate will not affect groundwater), and assess the uranium concentrations in soil that could result in exceeding the exposure risk to construction workers (CW-PRG).

The origin of uranium in groundwater at the Site may be attributed to the following mechanisms:

- The leaching of uranium from the unsaturated (vadose zone) and saturated zone soils to the underlying groundwater, and
- The historical release of uranium-containing wastewater directly to disposal pits and trenches that were in contact with fractures in shallow bedrock, thereby conveying uranium directly to the shallow groundwater.

The historical release of uranium via waste-water discharges contributed to the development of the current uranium plume in Site groundwater. The current and future uranium plumes at the Site are attributed to the leaching of uranium from the unsaturated soil. The plume shapes (shallow and deep zones) are controlled by the alignment of major fractures that serve as preferential flow and contaminant migration pathways, with the ongoing uranium leaching from the soil sustaining the uranium concentrations in the plume over time.

The focus of the SESOIL modeling presented in this report is on the leaching of residual uranium from the soil sources. The deteriorated state of the buildings and roofs allows for the intrusion of rain water and thus the presence of the buildings was not considered as a factor that will restrict the leaching of uranium from soil into groundwater (i.e., the buildings are ignored in the SESOIL and MODFLOW models so recharge is not influenced by them for conservation).

During the RI, a generalized SESOIL was used to conservatively reflect the entire Guterl Site. The contaminated soil area was defined as 6.7 ha (16.6 ac) and the unsaturated soil was divided into an upper 1 m (3.3 ft) thick contaminated zone (considered fill) and a 0.3 m (1 ft) thick lower uncontaminated zone (considered native silty-clay soil) based on a simplified generalization of borings data. Input parameters for soil properties were derived directly or indirectly from site-specific data and generic SESOIL guidance (Bonazountas and Wagner 1984). Since the half-lives for uranium are long, only advection, dispersion, and adsorption were modeled for uranium (i.e., first-order decay was ignored).

The SESOIL simulations for the FS were modified to incorporate additional site-specific geotechnical data and the variability in soil uranium concentrations with location and depth across the Site. SESOIL was used to simulate the leaching of uranium from the five soil areas shown on Figure 3-2 using the measured soil concentrations.

For each of the five soil areas, leachate concentrations were predicted for three scenarios:

- No action – soils are left in place "as is,"
- Soil removal – soils exceeding the PRGs developed for groundwater protection (GW-PRG) are excavated and removed, and
- Soil removal - soils exceeding the PRGs developed for the protection of construction workers (CW-PRG) are excavated and removed.

The Soil GW-PRG is defined as the concentration of uranium in soil that will be protective of groundwater, such that if all soils impacted with uranium greater than this PRG were excavated, and the current groundwater plume was addressed through a separate remedial action over a 30-year time frame, future leaching of uranium from the residual soil would not result in regrowth of a uranium plume greater than the MCL after 30 years of groundwater remedy implementation. Details of development of Soil GW-PRG are provided in Section 5.3.2.

The Soil CW-PRG is defined as the maximum concentration of uranium in soil that will result in acceptable risk of exposure to construction workers from residual radioactivity in soil, after soils impacted with uranium greater than the Soil CW-PRG were excavated. Details of prediction of groundwater impacts from residual soil uranium after removal of soils exceeding the CW-PRG are provided in Section 5.5.5.

5.2 Model Inputs

This section presents a detailed discussion of the SESOIL model input parameters.

5.2.1 Compartment Geometry

In order to develop leachate concentration estimates specific to individual source areas (as compared to the generalized RI model), the FS model divided the existing soil uranium data into five soil source areas. These areas were then vertically divided into subcompartments (or layers) from ground surface to a depth corresponding with the depth to groundwater in the area. Depths to groundwater were averaged from historic and August 2011 measurements at monitoring wells closest to the individual soil areas as shown in Table 5-1. The SESOIL model was assigned four main soil layers that had vertical thicknesses ranging from 15 cm (6 inch) to 60 cm (24 inch). The SESOIL layers were further divided into 15-cm (6-inch) sub layers. Tables 5-1 through 5-6 show the compartment geometry, the SESOIL layers, and sub layers for the five soil areas.

5.2.2 Soil Physical Properties

Subsurface soils at the Site predominantly consist of native soil and fill mixed with reworked soil. The native soils at the Site are described as a combination of a thin, discontinuous glaciolacustrine deposit of silts and clays overlying a thin, discontinuous glacial till composed of silt and clay with sand and bedrock fragments. Due to the extensive reworking of soils at the Site, the majority of subsurface soils reflect a sand and sandy silt mix in terms of properties applicable to movement of water and dissolved contamination.

The soil parameters are discussed in the following subsections and summarized in Table 5-2. Site-specific soil properties were used when available. When site-specific properties were not available, default physical parameters for sand and sandy silt were used.

5.2.2.1 Bulk Density

Bulk density represents the weight of soil materials divided by the soil volume (including pore space). The RI model used a bulk density value of 1.3 grams per cubic centimeter (g/cm^3) (81.2 pounds per cubic feet [lbs/ft^3]) based on results from on-site gamma spectroscopy analysis. This value is on the lower end of the general range for silty soil (1.29 to 1.80 g/cm^3 [80.5 to 112.4 lbs/ft^3]), but falls within the general range for sand (1.18 to 1.59 g/cm^3 [73.7 to 99.3 lbs/ft^3]) (Bonazountas and Wagner, 1984). Geotechnical samples were collected from the soil borings during the DGI and were submitted to the Shaw Geotechnical Testing Laboratory located in Knoxville, Tennessee. Bulk density was measured using the ASTM D2937-10 procedure and results ranged from 1.24 g/cm^3 to 2.08 g/cm^3 (77.4 to 129.9 lbs/ft^3). A value of 1.30 g/cm^3 (81.2 lbs/ft^3) was used in the FS model to reflect the sand/silty sand lithology of the disturbed soils, and to allow sufficient infiltration to accommodate 1.2×10^{-6} cm/sec (15 inches/year) groundwater recharge rate.

5.2.2.2 Effective Porosity

Effective porosity is a measure of the connected pore space in soils that transmit water. The RI model used an effective porosity value of 0.20 based on model guidance, silty clay soil type, and model calibration. Model guidance recommends values for effective porosity to be between 0.20 and 0.40, so the selected value was on the low end of the range of possible inputs. Geotechnical sampling and analysis conducted during the DGI determined an average effective porosity of 0.25 for the site, consistent with what would be expected for the sand/silty sand lithology of the reworked soils and within the range recommended by SESOIL guidance. The average bulk density of 1.30 g/cm^3 (81.2 lbs/ft^3) is indicative of a total porosity value of 0.51, which is probable for a reworked soil. An effective porosity value of 0.25 was used in the FS model.

5.2.2.3 Soil Pore Disconnectedness Index

The soil pore disconnectedness index relates soil permeability to soil moisture content. A value of 4 was used in the FS model based on the default value for a U. S. Department of Agriculture

textural soil class of sand/silty sand (Bonazountas and Wagner, 1984) and adjusted during model calibration.

5.2.2.4 Intrinsic Permeability

Intrinsic permeability is a measure of how easily fluids pass through a porous medium and can be calculated from the hydraulic conductivity of that medium. Geotechnical sampling of undisturbed soil samples collected at MW-600S was performed as part of the RI. A geotechnical evaluation of the data indicates a hydraulic conductivity value of approximately 1 x 10^{-5} centimeters per second (2.8 x10^{-2} ft/day). This value is converted to intrinsic permeability (in cm^2) by multiplying by 1 x 10^{-5}. The intrinsic permeability was further adjusted during calibration so that recharge would more closely match the 1.2 x 10^{-6} cm/sec (15 inches/year) groundwater recharge rate. Table 5-2 provides the adjusted intrinsic permeability values for each of the five soil source areas, which range from 2.8 x 10^{-8} to 5.7 x 10^{-8} cm^2 (3.0 x 10^{-11} to 6.1 x 10^{-11} ft^2). The equivalent adjusted hydraulic conductivity range is 2.8 x 10^{-3} to 5.7 x 10^{-3} cm/sec (8 to 16 ft/day).

5.2.3 Chemical Properties

The behavior of uranium is a function of its physical and chemical properties and the geochemical environment. The chemical-specific input parameters for uranium include molecular weight, water solubility, and the distribution coefficient (Kd). The chemical parameters are discussed in the following subsections and summarized in Table 5-3.

The presence of a non-AEC related volatile organic compound (VOC) plume in groundwater and its impacts on uranium geochemistry were considered. VOCs may locally impact groundwater conditions for a significant timeframe (i.e., create reductive groundwater zones while the contaminant degrades), but would not be as recalcitrant as uranium, which can persist throughout the 1,000-year performance period used in this evaluation (USACE 2012a). Geochemical modeling of the uranium in groundwater indicates that observed pH values (mostly above 7.0) and high carbonate concentrations (controlled by equilibrium with carbonate minerals) requires extremely reducing conditions (negative redox potentials) to reduce the hexavalent form of uranium to the tetravalent form that will precipitate as insoluble oxides. This condition explains the lower uranium concentrations below the excised structures, where the VOC is present in groundwater.

Although moderately reducing conditions exist at some locations (wells), which may include locations with VOCs, the uranium leachate from soil is predicted to remain as fully soluble hexavalent uranium in the groundwater. This is supported by sampling data that show the ratios of filtered to unfiltered uranium results are near unity (1); this indicates uranium is soluble whenever detected versus an adsorbed colloidal (or particulate) form. The conceptual site model assumes that long-term uranium mobility is unimpacted by the existence and/or eventual

degradation of the VOC plume under the excised area. This means the numerical flow and transport model will 1) not impede the advancement of the existing plume via VOC-related geochemical constraints and 2) assume leaching uranium may transport and develop uranium plumes uninfluenced by VOC impacts.

5.2.3.1 Molecular Weight

The default molecular weight of uranium (238 grams/mole) was used.

5.2.3.2 Water Solubility

Using data collected during the DGI, an additional evaluation of water solubility was performed. Using the Geochemist's Workbench geochemical model coupled with the MINTEQA2 thermodynamic database, a water solubility of 100 mg/L was derived for uranium based on site-specific pH, redox potentials, and groundwater compositions (USACE, 2012b). This values was used in the SESOIL model.

5.2.3.3 Distribution Coefficient Kd

The distribution coefficient Kd (or soil-water partitioning coefficient) is the ratio of a chemical's sorbed concentration on soil to the dissolved concentration in pore water. Distribution coefficients can be calculated using either an adsorption or desorption approach. The Kd value used for the RI model was based on laboratory tests of Site soil using adsorption. To calculate an adsorption Kd, water spiked with a high concentration of uranium was introduced to samples of uncontaminated soil from the Site, and the loss of uranium in water that is in contact with soil was used to determine Kd. The RI Kd tests employed a 24-hour batch test method using uranium spiked groundwater of differing concentrations (380 µg/L to 25,665 µg/L) shaken with initially uncontaminated Site soil samples. It may be noted that some of the uranium spike concentrations were as high as 100 times the uranium concentrations measured in Site groundwater. Those tests produced the following results:

- Native uncontaminated soil Kd: 1,247 and 1,452 milliliters per gram (mL/g)
- Contaminated soil/fill Kd: 5 to 97 mL/g
- Lockport Dolostone (gravel-sized grains) Kd: 0.22 mL/g

During the DGI, Kd values were calculated based on laboratory tests using a desorption approach. The set of uranium Kd tests performed during the DGI activities used undisturbed contaminated soil samples obtained during well installations. These soils were exposed to simulated precipitation in the form of uncontaminated synthetic rain water, as used in the Synthetic Precipitation Leach Procedure (EPA Method 1312) via column testing to better simulate actual leaching of uranium from on-site contaminated soils. Eight samples were tested in triplicate and produced Kd values ranging from 1,052 to 95,667 mL/g.

The DGI data produced higher Kd values than several of the RI results, likely because of the different approach utilized and the lower uranium in the more undisturbed soils used for the DGI analysis. The observed conditions in the contaminated soil areas indicate coarser grained material was reworked with native soils to create an apparently more permeable and potentially less adsorptive soil profile that is contributing to the uranium plume.

Consequently, an iterative modeling process of uranium leaching scenarios, coupled with an estimation of dilution in groundwater, established that a soil Kd value of 91 mL/g would generate the current groundwater plume over the last 50 years. It was concluded that a uranium Kd value of 91 mL/g is appropriate to be used in the FS soil leaching model.

5.2.4 Climate Data

As part of the software used for the SESOIL model, nation-wide climatic data are provided for input, including the Lockport 2 NE station. This station is located less than 8 km (5 miles) east of the Site and at a similar elevation of 158 m (518 ft) above msl. The software integrates the appropriate meteorological data from the climatic data records. The input parameters for the climatic data for each month include: temperature, cloud cover, relative humidity, short wave albedo, evapotranspiration, precipitation, storm length, number of storms, and length of rainy season.

5.3 Model Results

SESOIL model predictions are presented in the following sections.

5.3.1 No Action Scenario

The soil, chemical, and climate input parameters described previously were input to the SESOIL models for each of the five soil-source areas. Tables 5-4 through 5-8 present the soil source terms, representing the current (or baseline) concentrations in soil, which were used for soil areas 1 through 5. Soil-data analyses in the Data Gap Analysis Report (USACE, 2012a), the RI Report (USACE 2009), and the Oak Ridge Institute for Science and Education (ORISE) report (ORISE, 1999) were the basis of the input. Tables 5-4a through 5-4e reflect the comprehensive soil database, with the exception of the collocated samples that were analyzed at the on-site field screening laboratory by gamma spectroscopy and also at a fixed analytical laboratory by alpha spectroscopic analysis. For these collocated samples, the off-site alpha spectroscopic analyses were used instead of the gamma spectroscopic analyses.

Model inputs and outputs for each of the five soil area simulations are included in Attachments D-1 through D-5. The native SESOIL files corresponding to these simulations are provided in electronic format as Attachment G. Table 5-9 shows the SESOIL predicted leachate concentrations for each of five soil areas. The leachate concentration (before dilution with groundwater) is expected to exceed the MCL for hundreds of years under current conditions.

The leachate concentrations are expected to peak in the future at the following concentrations and timeframes:

- Soil Area 1: 28,370 µg/L at 265 ± 5 years
- Soil Area 2: 7,682 µg/L at 255 ± 5 years
- Soil Area 3: 5,298 µg/L at 235 ± 5 years
- Soil Area 4: 35,280 µg/L at 15 ± 5 years
- Soil Area 5: 281 µg/L at 235 ± 5 years

The leachate predictions over time will contribute to the groundwater plume, and will be used in Section 8 to model the future groundwater plumes for the No Action remedial alternative.

5.3.2 Soil Excavation to the Soil GW-PRG Scenario Model

The SESOIL model was run separately for each of the five soil source areas using soil profiles that were modified to reflect soil-source removal actions using a preliminary remedial goal for soil that would protect groundwater resources (or Soil GW-PRG) into the future. Based on an iterative set of runs of the soil leaching models and the groundwater model, it was determined a Soil GW-PRG of 11 milligrams per kilogram (mg/kg) total uranium (3.66 picocuries per gram [pCi/g] ^{238}U) would be protective of groundwater.

To reflect this cleanup goal in each soil area, the soil sample data were averaged in 15-cm (6-in) intervals and where average soil activity exceeded the Soil GW-PRG, the soil samples were systematically "excavated" from the database in a highest to lowest manner. These values were then replaced with uranium concentrations reflecting backfill containing background levels of uranium (2.2 mg/kg or 0.74 pCi/g U-238). This method simulates the remediation and backfill of soil with native soils. It was also assumed that all soils overlying the deepest location of the Soil GW-PRG exceedance in each area would be excavated (i.e., cover soils would be removed from deeper impacts).

In each of the 15-cm (6-in) intervals underlying the total excavation depth, there were a number of individual samples that remained and exceeded the Soil GW-PRG. However, the average of the uranium concentrations in the layers was less than the Soil GW-PRG. The uranium residuals in the intervals below the excavation depths, the residuals in surrounding soil, and the background level total uranium in the backfill were then re-modeled using SESOIL to assess the long-term leaching of uranium and the resulting longevity of the groundwater plume. The vertical averaging of soil intervals with no data and inclusion of background uranium adds conservatism to the "remediated" source-term estimations.

Tables 5-10 through 5-14 present the soil source terms for the soil excavation to the Soil GW-PRG scenario that were used for soil areas 1 through 5. Model inputs and outputs for each of the five soil area simulations are included in Attachments E-1 through E-5. The native SESOIL files corresponding to these simulations are provided in electronic format as Attachment G. Table 5-15 shows the SESOIL predicted leachate concentrations for each of the five soil areas. The leachate concentration (before dilution with groundwater) is expected to exceed the MCL for over 200 years. The leachate concentrations are expected to peak in the future at the following concentrations and timeframes:

- Soil Area 1: 77 µg/L at 25 ± 5 years
- Soil Area 2: 95 µg/L at 15 ± 5 years
- Soil Area 3: 36 µg/L at 140 ± 5 years
- Soil Area 4: 37 µg/L at 25 ± 5 years
- Soil Area 5: 37 µg/L at 25 ± 5 years

The leachate predictions over time will contribute to the groundwater plume and will be used in Section 8.0 to model the future groundwater plumes after the soil excavation is complete. A portion of Soil Area 2 and most of Area 5 fall within the NYSDEC inactive hazardous waste disposal site footprint, as delineated on Figure 3-2, but will still be included in the remedial alternatives to address the site holistically under FUSRAP and ensure success of all soil alternatives.

It may be noted that the configurations of the groundwater plumes are controlled partly by the alignment of major fractures or lineaments that serve as preferential flow and contaminant migration pathways in the bedrock. Uranium leaching from soil sustains the plumes, but may not directly correlate to groundwater concentrations immediately underneath the source areas due to dilution and dispersion in the aquifer.

5.3.3 Soil Excavation to the Soil CW-PRG Scenario Model

The preliminary remedial goal for soil to protect the construction worker from radiation exposure (or Soil CW-PRG) was developed during the RI using the RESRAD model (ANL, 2001). As described in the FS, the Soil CW-PRG is 23 pCi/g ^{238}U (69 mg/kg total uranium). The CW-PRG is based on a total dose of 20 millirem per year (mrem/year) for all complete pathways, which allows for an additional 5 mrem/yr to come from consumption of on-site drinking water with uranium concentrations limited to 30 µg/L. This ensures the combined pathway dose remains limited to 25 mrem/yr under 10 CFR 20. The Soil CW-PRG is based on the minimum residual radioactivity for individual isotopes converted to total uranium by including contribution to dose from ^{234}U, ^{235}U, and ^{238}U, assuming natural abundance of uranium isotopes (in ratio of ^{234}U:

^{235}U: ^{238}U 1:0.046:1). ^{238}U can be used as surrogate for total uranium derived concentration guideline level distributed over a wide area (DCGLw) by multiplying the total uranium DCGLw by ^{238}U's activity fraction (0.489).

The evaluation of soil for the protection of construction workers also incorporates the sum of fractions (SOR) rule, so that the dose limit is not exceeded when more than a single radionuclide is present in soils. According to the SOR rule, a SOR greater than 1 represents unacceptable exposure and a SOR less than or equal to 1 represents acceptable exposure; if there are multiple radionuclides in the medium being evaluated, the sum of the ratios for all of the radionuclides must also be less than or equal to 1. For the construction worker evaluation, SOR values were generated using the Soil CW-PRGs developed by USACE for ^{238}U and for ^{232}Th.

Tables 5-16 through 5-20 present the soil source terms for the soil excavation scenarios that were used for soil areas 1 through 5. In each soil area, the soil sample data were averaged in 6-inch intervals, and if the average soil activity exceeded either the Soil CW-PRG and/or the SOR was greater than 1, the soil was excavated and replaced with backfill that was assigned background-level uranium (2.22 mg/kg; 0.74 pCi/g) (as discussed in Section 5.3.2.). It was assumed that all soils overlying the deepest location of a Soil CW-PRG exceedance in each area would be excavated, so that after excavation the average of each 6-inch interval was not to exceed the Soil CW-PRG of 23 pCi/g of ^{238}U.

The soil excavation to Soil CW-PRG model also used 15-cm (6-in) increments for SESOIL soil concentrations. In each of the intervals underlying the total excavation depth, some individual samples remained and exceeded the Soil CW-PRG. However, the average of the uranium concentrations in the layers was less than the Soil CW-PRG. The residual total uranium in the intervals below the excavation depth, surrounding the remedial area, and in the background-level backfill were modeled using SESOIL. The results predicted leachate concentrations that contribute to the long-term uranium input to the groundwater uranium plume (i.e., under the CW-PRG, more uranium remains in the soil and leaches at greater concentrations for a longer period that the GW-PRG).

The vertical averaging method to create soil-profile input where data do not exist adds conservatism to the source-term estimation, and presents a worst-case scenario. This is especially important in soil area 3, where highly impacted 6-inch soil increments are used to populate the adjacent layers without data. For example, Table 5-18 shows the 30 to 36 inch bgs interval averaging 67.09 mg/kg total uranium, which includes high-concentration residuals, and thus increases the estimated concentration of total uranium to 34.14 mg/kg in underlying 18-inches of soil (36 to 48 inch bgs), where no samples were collected.

The SESOIL model was run separately for each of the five soil source areas using the scenario where soil-source removal to the Soil CW-PRG has taken place. Model inputs and outputs for each of the five soil area simulations are included in Attachments F-1 through F-5. The native SESOIL files corresponding to these simulations are provided in electronic format as Attachment G. Table 5-21 shows the SESOIL predicted leachate concentrations for each of the five soil areas after excavation using the Soil CW-PRG. The leachate concentration (before dilution with groundwater) is expected to exceed the MCL for over 490 years. The leachate concentrations are expected to peak in the future at the following concentrations and timeframes:

- Soil Area 1: 71 µg/L at 15 ± 5 years
- Soil Area 2: 306 µg/L at 25 ± 5 years
- Soil Area 3: 607 µg/L at 85 ± 5 years
- Soil Area 4: 36 µg/L at 135 ± 5 years
- Soil Area 5: 279 µg/L at 235 ± 5 years

The leachate predictions over time will contribute to the groundwater plume that simulated future groundwater plumes after the soil excavation to the Soil CW-PRG is complete. This alternative includes soils in the NYSDEC inactive hazardous waste disposal sitefootprint that will be holistically included in proposed alternatives to ensure completeness of the selected remedy.

For the guiding soil excavation during field implementation, the Soil CW-PRG of 23 pCi/g (69 mg/kg) will likely be treated as a DCGLemc (elevated measurement exposure concentration or never-to-exceed concentration), so individual soil concentrations exceeding the DCGLemc would be excavated. The Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM, U.S. NRC, 2000) will be used to confirm compliance with the Soil CW-PRG.

Tables 5-16 through 5-20 compare the post excavation soil concentrations for the two approaches where excavations are guided by DCGLw and DCGLemc. For the deeper soil intervals where no excavation is recommended using the DCGLw approach that is used for the FS, often the residual soil concentrations using the DCGLemc approach is lower.

Since both Soil PRGs (CW and GW) are likely to be implemented as never-to-exceed soil concentrations during remediation, the soil to groundwater modeling approach used in this FS is conservative (i.e., it assumed isolated exceedances of the PRG would remain as long as the average COC concentration in that 6-inch interval was less than the PRG). This approach is used for all soil and groundwater alternatives presented in this FS Report. As a result, this conservative modeling approach results in longer persistence of uranium plumes in the shallow and deep groundwater, and represent an upper bound of the period of performance (i.e.,

estimated number of years) to achieve the MCL. Refinement of this modeling approach may be conducted in the future (i.e., after the remedy is in place and residuals are redefined), but the current approach allows for a relative comparison of each of the soil and groundwater alternatives presented in this FS Report.

6.0 GROUNDWATER FLOW MODEL

A groundwater flow model was constructed and calibrated as a steady-state model, following the assumptions presented in Section 3.2. The steady state approach was based on the assumption that the variability in groundwater flow over time is small in comparison to the variability in groundwater flow conditions across the model area. The effects of seasonal groundwater fluctuations can be ignored while predicting the long-term (30 to 1,000 years) behavior of the groundwater flow field and uranium plume migration if near average groundwater conditions are input to the model. Therefore, the steady state modeling approach was appropriate for the model use as a tool for the analysis of long-term feasibility study scenarios, such as no action, MNA, and groundwater extraction.

6.1 Groundwater Flow Model Setup

Model construction details are described in the following sections.

6.1.1 Delineation and Discretization of Spatial Domain

The groundwater model area of interest includes the Site and off-site areas as defined in Section 2.1 and shown on Figure 6-1. The model grid was oriented so that one of the grid axes was aligned with the predominant flow and transport direction (i.e., northwest to southeast), which reduces simulation error caused by deviation from the directions of principal hydraulic conductivity tensor. Fracture trace lineaments found in the Guterl Site area also show a general northwest-southeast fracture trace orientation pattern north of the Erie Canal. Since these regional fractures may act as preferential pathways for groundwater migration, it was important that the model grid also accounted for this orientation.

The model was spatially discretized into a number of three-dimensional (3-D) finite-difference, block-centered cells. This was achieved by spatially dividing the model domain into 155 rows and 120 columns and vertically into 3 layers, resulting in a total of 55,800 cells, out of which 39,149 cells were designated active for modeling (i.e., within the flow regime). The remaining 16,657 cells, located outside the model area of interest, shown on Figure 6-1, were considered inactive for modeling. Individual cell size was 15.24 m x 15.24 m (50 ft x 50 ft) in horizontal dimensions, with the vertical dimension based on the saturated thickness of the layer described in Section 6.1.2.

6.1.2 Layer Thickness

Vertically, the model was divided into three layers that mimic the conceptual site model compiled from available geologic data and interpretations. These data included the soil and rock boring logs, geologic cross-sections, and estimates of hydraulic conductivity values from several locations across the model domain.

The three hydrostratigraphic units in the aquifer system are described below:

- Layer 1: Shallow groundwater bearing bedrock (fractured dolostone) – average 6.7 m (22 ft) in layer thickness and average 5.2 m (17 ft) in saturated thickness

- Layer 2: Deep groundwater bearing bedrock (dolostone containing the first main fracture zone) – average 11.6 m (38 ft) in layer thickness and fully saturated

- Layer 3: Shaly dolostone bedrock grading into shale – extends from the base of Layer 2 to approximately 24.4 m (80 ft) below land surface, with an average thickness of 6.7 m (22 ft) and fully saturated

The three layer vertical discretization of the model domain is a simplification of the subsurface site lithology presented in a geologic cross-section shown on Figure 2-1. The layers are identified on Figure 3-1. It may be noted that the first main fracture zone, shown in blue on Figure 3-1, is a part of Layer 2, which in addition contains dolostone that is not as intensely fractured, and therefore, not as transmissive as the first main fracture zone. As a result, the overall hydraulic conductivity (or permeability) of Layer 2 is less than Layer 1, which has been documented by the slug tests conducted in Layers 1 and 2.

Layer 3 does not have monitoring wells installed and there is no information available on groundwater flow in this layer. It was incorporated in the model in order to provide a potential vertical exit path for groundwater from Layer 2. Although groundwater flows into Layer 3, uranium concentrations are expected to be nearly a magnitude of ten lower than Layer 1 or 2 (i.e., the first fracture zone, or Layer 2, is assumed to receive uranium from the shallow zone and primarily transmit it toward the Erie Canal rather than promote vertical transport). This condition is exemplified by the measured uranium concentrations that reduce by a factor of 3 or more between Layers 1 and 2. Considering that Layer 3 is expected to have lower hydraulic conductivity and transmissivity due to a decrease in fracture density with depth, uranium concentrations are expected to be below the MCL in Layer 3.

6.1.3 Hydrogeologic Properties

6.1.3.1 Hydraulic Conductivity

Hydraulic conductivity varies spatially between different locations, commonly referred to as heterogeneity, which may occur in the horizontal and vertical dimensions. Horizontal heterogeneity represents the lateral change in hydraulic conductivity and typically results in delineation of hydraulic conductivity zones. The measured hydraulic conductivity data for Layers 1 and 2 were reviewed in an effort to delineate hydraulic conductivity zones. Average and median values for hydraulic conductivity in the shallow weathered bedrock (shallow

groundwater) are 9.8 x 10^{-3} cm/sec (27.8 ft/day) and 4.2 x 10^{-3} cm/sec (11.9 ft/day), respectively. Average and median values for hydraulic conductivity in the first main fracture zone (deep bedrock) are 2.6 x 10^{-3} cm/sec (7.5 ft/day) and 1.1 x 10^{-3} cm/sec (3.2 ft/day), respectively. The geometric means of hydraulic conductivity values in the shallow weathered bedrock and the first main fracture zone are 3.5 x 10^{-3} cm/sec (10 ft/day) and 3.5 x 10^{-4} cm/sec (1 ft/day), respectively.

The Site data indicated that the lateral variation in hydraulic conductivity has no apparent trend or pattern since the flow is controlled by weathered fractures that are well connected. Information from regional studies indicates the presence of a regional fracture trace, aligned northwest to southeast, extending from the northwest corner of the site to the Erie Canal. This fracture trace is aligned with the centerline of the shallow and deep groundwater uranium plumes shown on Figure 3-2, and is inferred to be a zone of high hydraulic conductivity and preferential groundwater flowpath. The hydraulic conductivities assigned to model cells range from 7.4 x 10^{-3} cm/sec (21.1 ft/day) to 2.5 x 10^{-2} cm/sec (69.9 ft/day) in Layer 1 (shallow groundwater) and 2.7 x 10^{-3} cm/sec (7.7 ft/day) to 1.9 x 10^{-2} cm/sec (53.3 ft/day) in Layer 2 (deep groundwater).

Vertical heterogeneity is caused by the variation of hydraulic conductivity with depth. The measured hydraulic conductivity data for Layers 1 and 2 indicate that Layer 1 has, in general, higher hydraulic conductivities than Layer 2, with the geometric mean of hydraulic conductivities in Layer 1 (3.5 x 10^{-3} cm/sec [10 ft/day]) being an order of magnitude higher than the geometric mean of hydraulic conductivities in Layer 2 (3.5 x 10^{-4} cm/sec [1 ft/day]). No hydraulic conductivity measurements are available from Layer 3, although based on the lithology and the general trend of decreasing fracture density with depth, Layer 3 is expected to have lower hydraulic conductivities than both Layers 1 and 2.

The measured hydraulic conductivities were used in the flow model as initial estimates and were refined later during the calibration process described in Section 6.2.

6.1.3.2 Hydraulic Conductivity Anisotropy

Hydraulic conductivity may also vary as a function of spatial orientation (i.e., at the same physical location, the hydraulic conductivity may vary by direction). The directional hydraulic conductivity variation is referred to as anisotropy. For the initial model setup, an anisotropy of 1.0 (same hydraulic conductivity in different directions) was used and varied, as required, during the model calibration process. The calibration did not require this anisotropy value to deviate from 1.0.

6.1.3.3 Groundwater Recharge

Precipitation is reported to be distributed uniformly over the year at the Guterl Site. The Site is located in Niagara County, which receives an average of 88.6 cm (34.9 inches) of precipitation per year, a portion of which recharges the groundwater. Based upon the SESOIL model

performed during the FS, the HELP model of precipitation, and the RESRAD modeling performed during the RI, a recharge rate of 1.2 x 10^{-6} cm/sec (15 inches per year) was established. The recharge was applied to the highest active cell (i.e., Layer 1 model cells) except in the quarry area where the recharge was applied to the Layer 2 cells where the shallow bedrock is missing or dewatered.

6.1.3.4 Hydraulic Head Distribution

The August 3, 2011 groundwater elevation data were used to calibrate the flow model since this was the most complete dataset for the model domain available at the time of model construction. Acceptable model calibration and associated residual values were determined based on comparison to this dataset. Subsequent water-level data collected through 2016 indicate that groundwater flow directions do not significantly change from season to season, or year to year. In addition, no significant site changes (e.g., building demolition or construction) have occurred since 2011. Consequently, the august 2011 dataset still applies to site conditions.

6.1.4 Establishment of Boundary Conditions

Boundary conditions were specified at the edges, top, and bottom of the groundwater flow system as follows:

- At the top of the aquifer system (or the highest active cells in either Layers 1 or 2), the boundary condition included net precipitation recharge (rainfall minus runoff and evapotranspiration). The top of the model layers that contact the ground surface were assigned the elevations coincident with the topographic surface, which allows for the delineation of flooded cells to correct during calibration.

- The Erie Canal is located in the southern part of the model and was treated as a MODFLOW RIVER type boundary. The RIVER boundary allows for groundwater and surface-water interaction. Groundwater may flow to the RIVER cells from the adjacent aquifer cells if the groundwater elevations in the aquifer are higher than the RIVER stage. Conversely, the RIVER cells may lose water to the aquifer cells if the aquifer groundwater elevations are lower than the stage in the RIVER cells. This boundary was assigned to model Layers 1 and 2. The Erie Canal is shallower than the top of Layer 3, so a RIVER boundary was not placed in Layer 3.

- The quarries were prescribed a General Head Boundary (GHB), as they are dewatered and groundwater elevation is assumed to be at or below the quarry bottom elevation of approximately 169 m (555 ft) above msl. The GHB boundary specifies a head to each cell such that if the surrounding groundwater elevation rises above the specified head, water flows out of the aquifer. If the groundwater elevation falls below the specified head, water flows into the aquifer.

- The bottom boundary of the model was a no flow boundary to represent the lack of flow of groundwater into the underlying Rochester Shale, which is considered an aquitard and a barrier to groundwater flow.

- For the initial model run, all other boundaries were modeled as open (variable head) boundaries. The boundary conditions were modified, as appropriate, during the model calibration process.

Details of the final (calibrated) boundary types selected are provided in Section 6.2.

6.1.5 Groundwater Extraction

Groundwater is extracted at the quarries to the west of the Guterl Site. Extraction rates are not known and, therefore, the quarries were modeled as GHB, with heads coincident or below the quarry floor. Consequently, no groundwater extraction wells included in the baseline model.

6.2 Calibrated Model Description

Groundwater flow models are compiled to mathematically replicate field-observed groundwater levels and hydrogeologic information, which then can be used to make predictions regarding groundwater flow and solute transport at the Guterl Site. The numerical simulation is first calibrated to a set of hydraulic features and hydrogeologic parameters such as recharge, hydraulic conductivity values, anisotropy ratios, and boundary conditions (calibration parameters) that reproduce a set of field measurements, such as groundwater elevations at selected wells (calibration targets), within an acceptable range of error. The August 3, 2011, groundwater elevation dataset was used for calibration since it contains 51 monitoring wells, 40 screened in the shallow groundwater and 11 screened in the deep groundwater.

Model calibration was performed through an iterative process of varying the input parameters until acceptable results were obtained. After each calibration run, statistics and predicted head values were reviewed to define the best statistical fit model solution, which is summarized in Table 6-1. The hydraulic conductivity distribution for the calibrated model is presented in Table 6-2. Layers 1 and 2 had 18 hydraulic conductivity zones, with the highest hydraulic conductivities assigned to the zones aligned with the regional fracture trend through the middle of the Guterl Site. Layer 3 had only one hydraulic conductivity zone. The hydraulic conductivity zones are displayed graphically on Figure 6-5.

6.3 Evaluation of Model Calibration

6.3.1 Statistical Evaluation

Model calibration results were quantitatively evaluated on the basis of the overall statistical match between the measured and simulated groundwater elevations across the flow field. As

recommended by Anderson and Woessner (1992), three ways of expressing the difference between the measured and simulated groundwater elevations were utilized. These statistical parameters were expressed as a percentage of the total head drop measured across the modeled area and are described in the following paragraphs.

- **Mean Error (ME)** is a measure of the average difference between the simulated and the measured groundwater elevations (residual mean). The calibrated model has a ME of less than 1 percent of the range of hydraulic heads measured across the Site, calculated as follows:

$$ME\% = \frac{ME\ (0.18\ ft)}{Head\ Range\ (35.98\ ft)} * 100 = 0.51\%$$

- **Mean Absolute Error (MAE)** is a measure of the average absolute difference between the simulated and the measured groundwater elevations (residual absolute mean). The calibrated model has a MAE of 7 percent of the range of hydraulic heads measured across the Site, calculated as follows:

$$MAE\% = \frac{MAE\ (2.68\ ft)}{Head\ Range\ (35.98\ ft)} * 100 = 7.45\%$$

- **Root Mean Square Error (RMSE)** is a measure of the standard deviation of the simulated values from the measured groundwater heads (standard deviation of residuals). Since the RMSE measures the average of the squared differences in the simulated and observed data, it is typically higher than the ME or the MAE. The calibrated model has a RMSE of 12 percent of the range of hydraulic heads measured across the Site, calculated as follows:

$$RMSE\% = \frac{RMSE\ (4.32\ ft)}{Head\ Range\ (35.98\ ft)} * 100 = 12.01\%$$

These combined statistical results indicate that the three-layer, 3-D model is appropriately calibrated (with minimal bias) for a transport analysis and FS-level predictions of remedial alternatives.

Groundwater flow model calibration results are reported in Table 6-3 by providing a listing of the measured and simulated groundwater elevations at each of the 51 calibration target monitoring well locations.

6.3.2 Groundwater Flow Patterns

The results of the flow model calibration were evaluated qualitatively. Groundwater elevation contours generated on the basis of the modeled dataset were plotted on the Site map for Layer 1 (Figure 6-6) and Layer 2 (Figure 6-7). While there are some differences, including differences due to interpretation, the contours are generally similar in shape to those based on the August 2011 measurements presented in the Final DGI Technical Memo (Figures 4-12 and 4-13). No monitoring wells are installed in Layer 3 for comparison to calculated values, so statistics are not available for Layer 3 (i.e., the calculated values are assumed representative of site conditions).

6.3.3 Evaluation of Systematic Bias

A scatter plot of the measured versus simulated heads (correlation among residuals) is shown on Figure 6-8; this was utilized to qualitatively evaluate the randomness of the calibration errors. For an ideal calibration with zero error, the correlated residual data are expected to be aligned along the 45 degree line shown on Figure 6-8. All models have some calibration error, including the one calibrated for the Guterl Site, which is represented by deviation from the 45 degree line. In a biased model, the majority of the errors are above or below the line, indicating that the model either systematically over predicts the groundwater elevations or under predicts them. No systematic biases were observed in the calibrated model as shown by some of the data points aligned with the 45 degree line, some above it, and some below it, although there is a cluster of wells that appear below the 45 degree line, yet these wells are not geographically clustered in the model (i.e., precludes spatial bias).

6.3.4 Sensitivity Analysis

A sensitivity analysis of the model calibration was conducted by changing key model input parameters and evaluating the effects of these changes on the model output. The parameters and the range of parameter values used for sensitivity analysis are as follows:

- Hydraulic Conductivity – 5, 2, 0.5, and 0.2 times the best statistical fit values, performed for each of the three model layers
- Horizontal Hydraulic Conductivity Anisotropy – 5, 2, 0.5, and 0.2 times the best statistical fit values, performed for each of the three model layers
- Vertical Hydraulic Conductivity Anisotropy – 5, 2, 0.5, and 0.2 times the best statistical fit values, performed for each of the three model layers
- Recharge – 1.67, 1.33, 1.25, 1.1, 0.9, 0.83, 0.67, and 0.33 times the best statistical fit value

The results of the model sensitivity analysis are tabulated in Table 6-4 and summarized below.

1. Horizontal Hydraulic Conductivity – Model calibration is sensitive slightly to changes in hydraulic conductivity of Layers 1 and 2, but not in Layer 3. At certain ranges, such as when horizontal hydraulic conductivities were increased to 5 times the calibrated values for Layer 1 or decreased to 0.5 times and 0.2 times the calibrated values in Layer 2, the model failed to converge. This indicates the values were out of range of model calibration and produced an unstable solution.

2. Horizontal Hydraulic Conductivity Anisotropy – Model calibration is sensitive to changes in horizontal hydraulic conductivity anisotropy of Layers 1 and 2, but not very sensitive to changes in Layer 3. At certain ranges, such as when horizontal hydraulic conductivities were increased to 5 times the calibrated values for Layer 2 or decreased to 0.5 times and 0.2 times the calibrated values in Layer 2, the model failed to converge.

3. Vertical Hydraulic Conductivity Anisotropy – Model calibration is not sensitive to changes in vertical hydraulic conductivity anisotropy in any of the three layers.

4. Recharge – Model calibration is sensitive to changes in recharge. If the recharge was increased more than 10 percent of the calibrated value of 1.2×10^{-6} cm/sec (15 inches/year), the model failed to converge indicating that the flow system is not subject to recharge rates much higher than the calibrated model. As the recharge rate was decreased, the model calibration error also increased, indicating that lower recharge values are not appropriate.

Overall, the calibration is stable and can be altered to test remedial alternatives for the FS analyses.

7.0 REMEDIAL ALTERNATIVES MODEL

The baseline model of groundwater flow and uranium transport was then used to evaluate the various remedial alternatives under consideration in the Guterl FS. The modeling results are expected to support the FS goals by providing the following:

- The fate and future extent of uranium plumes in shallow and deep groundwater when subjected to the various groundwater remedial alternatives;
- The effectiveness of individual remedial alternative in meeting the RAOs identified in the FS; and
- The timeframes necessary to meet the RAOs.

The following sections provide a brief description of the modeling approach and results.

7.1 Modeling Procedures and Input Parameters

The following feasibility study alternatives were evaluated using uranium transport modeling:

- Alternative G1 – No Action (i.e., perpetuation of current conditions)
- Alternative G2 – Monitored Natural Attenuation (MNA) with Environmental Monitoring and Land Use Controls (LUCs) after the Soil CW-PRG is Implemented
- Alternative G3 – Monitored Natural Attenuation (MNA) with Environmental Monitoring and Land Use Controls (LUCs) after the Soil GW-PRG is Implemented
- Alternative G4 – Groundwater Recovery using Vertical Wells and a Rubblized Trench with Ex Situ Treatment, Groundwater Monitoring, and LUCs after the Soil CW-PRG is Implemented
- Alternative G5 – Groundwater Recovery using Vertical Wells and a Rubblized Trench with Ex Situ Treatment, Groundwater Monitoring, and LUCs after the Soil GW-PRG is Implemented

The native MODFLOW and MT3DMS model files corresponding to the simulations of these alternatives are provided in electronic format as Attachment H (CD ROM).

For the No Action Alternative, it was assumed that soils will be left in place and no groundwater treatment will be performed, so soil-based uranium is expected to continuously leach to groundwater for hundreds of years. The leachate concentrations over time were predicted, as

described in Section 5.3.1, and applied to the groundwater as transient recharge with concentrations varying over time. The leachate was allowed to mix with the existing groundwater plume that together were subjected to fate and transport processes, such as advection, dispersion, and adsorption. The existing groundwater plume was prescribed in the model based on concentrations measured in August 2011 and reported in the Final DGI Technical Memo (USACE, 2012b). A trend analysis of the uranium data from each well (Attachment A) and a comparison of plume distributions derived from the annual sampling program (2012 to 2016) indicate the 2011 dataset still is appropriate to represent site conditions. A flow chart describing the modeling process for the No Action alternative is presented on Figure 7-1.

Under alternatives G3 and G5, the source-area soils exceeding the Soil GW-PRG would be removed. The residual soil-based uranium is expected to continuously leach to groundwater at lower concentrations than the no-action scenario. The leachate concentrations over time were predicted, as described in Section 5.3.2, and applied to the groundwater as transient recharge with concentrations varying over time. The leachate was allowed to mix with the existing groundwater plume, and the resultant plume was subjected to natural attenuation processes such as advection and dispersion for both alternatives, as well as active groundwater extraction for alternative G5. A flow chart describing the modeling process for the MNA based alternative (G3) is presented on Figure 7-2, while the approach for the extraction-based alternative (G5) is presented on Figure 7-3.

Under alternatives G2 and G4, the source-area soils exceeding the Soil CW-PRG would be removed under a MARSSIM approach. The residual soil uranium is expected to continuously leach to groundwater at lower concentrations than the no-action scenario, but at much higher concentration than the Soil GW-PRG soil removal alternative. The leachate concentrations over time were predicted, as described in Section 5.3.3, and applied to the groundwater as transient recharge with concentrations varying over time. The leachate was allowed to mix with the existing groundwater plume, and the resultant plume was subjected to natural attenuation processes such as advection and dispersion (G2), along with active groundwater extraction (G4). Flow charts describing the modeling processes for these alternatives are presented on Figure 7-4.

Information regarding the uranium transport and associated parameters such as aquifer porosity values, bulk density, and distribution coefficient (Kd) were based on data presented in the RI and Final DGI Technical Memo (also previously mentioned in this appendix). Approximations were made for Layer 3, for which measured values are not available. Due to the long half-life of uranium (4.5 billion years), and considering that time frame for remedial scenario analysis is 1,000 years, radioactive decay was not included in the modeling assessment.

Dispersion coefficients for Layers 1 and 2 were estimated based on the lengths of the uranium plume in the shallow and deep bedrock as 823 m and 457 m (2,700 and 1,500 ft), respectively using the following equation.

- Longitudinal Dispersivity (Xu and Eckstein, 1995)

$$\alpha_x = 3.38 \times 0.83 \times \left[log_{10}\left(\frac{L_p}{3.28}\right)\right]^{2.414}$$

Where:

α_x is the longitudinal dispersivity, in ft; and

L_p is the plume length, in ft

- Transverse dispersivity $\alpha_T = \alpha_x / 10$ (Gelhar et al., 1992)

- Vertical dispersivity $\alpha_v = \alpha_x$ x 1 x 10^{-9} (conservative estimate)

These results and a summary of solute modeling input parameters is provided in Table 7-1.

Initial groundwater concentrations for uranium transport modeling are based on the August 2011 data presented in the Final DGI Technical Memo. For making future projections of uranium concentrations under various feasibility study scenarios, it was assumed that these initial concentrations represent the "year zero" (or starting) conditions.

7.2 Alternative Analysis Modeling Results

The results of modeling of the remedial alternatives in terms of time needed to attain RAOs are summarized in Table 7-2. The following factors need to be considered when examining the model results:

1. The deteriorated state of the buildings and roofs allows for infiltration of rain water; therefore, the alternative analysis did not include the presence of the buildings (i.e., recharge was assigned as if the buildings were decayed).

2. The model predictions and associated figures indicate that some of the uranium-impacted groundwater underneath the Site is migrating toward the Erie Canal. The Erie Canal is located across from the southeastern boundary of the Site, approximately 90 meters (m) (300 ft) south of the Site. Emergency drinking water for the City of Lockport is occasionally supplied from the Summit Street intakes located in the Erie Canal immediately southeast of the Site. Two surface water samples collected on May 7, 2012 and on October 25, 2012 near the emergency water intake show uranium concentrations

ranging from 0.5 to 0.6 µg/L, which reflect background values in the Erie Canal that are attributed to naturally occurring uranium derived from groundwater baseflow and surface runoff to the canal system. Subsequent canal-water samples taken annually from 2013 through 2016 are also consistent with this range (0.37 to 0.61 ug/L total uranium).

During the navigation season (normally April 20 to November 20), groundwater containing uranium from the Guterl Site mixes with the flow in the Erie Canal and is diluted by a factor of approximately 1,200. This is reflected in the sampling data that shows uranium in the Erie Canal is well below the MCL of 30 ug/L and indistinguishable from background. During the non-navigation season (November 21 to April 19), there is no measurable flow in the Canal in the vicinity of the emergency water intake, and therefore, the Erie Canal does not function as a potential emergency water supply source during this time period. Groundwater seepage to the canal mixes with approximately 0.6 m (2 ft) of standing water normally present in the Erie Canal. Considering that the observed seep flow rates are low (less than 1 gallon per minute or 0.002 cfs), the risk of incidental exposure from ingestion of uranium in the emergency drinking water supply is absent.

The highest measured total uranium concentration at the Guterl Site is 302 µg/L, measured in September 2009 at MW-605D. If this concentration was transferred directly to the Erie Canal and diluted, the resulting maximum concentration would be 0.25 µg/L; this would be added to the background uranium concentration of 0.4 µg/L and result in a maximum surface water concentration of 0.65 µg/L for total uranium in the Erie Canal. This estimated maximum concentration is below the MCL for drinking water and indistinguishable from the current observations from the Erie Canal (2007 to 2016 sampling range is 0.3 to 0.7 µg/L).

Mass balance calculations indicate that as long as groundwater seepage concentrations to the canal do not exceed 35,500 µg/L, the resulting Erie Canal water will not exceed the 30 µg/L total uranium MCL. Such a high uranium value is not observed in groundwater on the Guterl site, nor is it predicted to achieve that value in seepage.

Details of mass balance calculations and figures showing locations of surface water samples and measured values are included in Appendix D of the FS.

Detailed discussions for each of the individual alternatives are provided in the following sections.

7.2.1 No Action

The simulated uranium concentrations in the shallow groundwater are shown on Figure 7-5, which shows changes in the plume configuration over time due to soil leachate contributions and the existing plume. The uranium concentrations persist above the MCL for approximately 780

±5 years. Portions of the shallow groundwater plume remain off site in the vicinity of the southern property boundary towards the Erie Canal for approximately 670 ±5 years, and off site in the vicinity of the western boundary towards the Quarry for approximately 710±5 years.

The simulated uranium concentrations in the deep groundwater are shown on Figure 7-6; the plume changes due to soil leachate contributions, plume transport, and vertical migration to the deep zone, where concentrations persist above MCL for over 1,000 years. Portions of the deep groundwater plume remain off site for the entire 1,000-year simulation along both the southern property boundary towards the Erie Canal and western boundary towards the Quarry. The inactive hazardous waste disposal site in the northwestern corner is predicted to act as a source term for groundwater contamination for approximately 750±5 years.

7.2.2 Soil Excavation to CW-PRG, Monitored Natural Attenuation in Groundwater, LUCs

A simulation of the complete removal of soils that exceed the Construction Worker risk threshold (or Soil CW-PRG) was assembled to predict the groundwater reaction to the remedy, and thus a pace of the natural attenuation of residual uranium. The predicted uranium-concentration maps for the shallow groundwater is shown on Figure 7-7. Due to leachate contributions from residual uranium in soil, the existing plume persists at concentrations above MCL for approximately 430±5 years. The uranium plume shrinks to within the southern property boundary towards the Erie Canal in 20 years and the western boundary towards the Quarry after approximately 300±5 years due to the persistence of the inactive hazardous waste disposal siteplume.

The uranium concentration distribution in the deep groundwater is shown on Figures 7-8. Due to vertical contributions from the shallow groundwater plume, the existing deep plume persists at concentrations above MCL for approximately 660±5 years. A portion of the uranium plume remains off site for 400±5 years.

In general, soil excavation to the Soil CW-PRG followed by MNA results in a decrease in the persistence of the uranium in groundwater as compared to the no action alternative, which does not include soil removal. The long attenuation period is due to the release of uranium mass remaining in the soil profile after the CW-PRG remedy is in place. During the 1,000 year evaluation period, the highest predicted groundwater concentration is 291 µg/L in shallow groundwater at year 90 approximately north of Building 2.

7.2.3 Soil Excavation to GW-PRG, Monitored Natural Attenuation in Groundwater, LUCs

A third simulation included the removal of soils that exceed the Soil GW-PRG (or 11 mg/kg) and the associated natural attenuation rates from the residual contamination. The predicted uranium concentrations in the shallow groundwater are depicted on Figure 7-9, which show changes in plume configuration over time. The GW-PRG leaves significantly less residual uranium in the

soil profile, which is reflected in the relatively shorter lifecycle of the existing plume. The majority of the site is expected to meet remedial goals within approximately 50±5 years.

The uranium concentration distributions in the deep groundwater are shown on Figure 7-10, which shows uranium migrating vertically out to the deep zone, where lower groundwater velocities and pore-volume flushing allows the existing plume to persist at concentrations above MCL for approximately 120±5 years.

In general, soil excavation to the Soil GW-PRG produced a significantly greater pace of natural attenuation and a substantial decrease in the persistence of the uranium plume as compared to the no action alternative, which does not include soil removal, and the CW-PRG alternative. During the 1,000 year evaluation period, the highest predicted groundwater concentration is 206 µg/L from the shallow groundwater at year 0 below Building 37.

7.2.4 Soil Excavation to CW-PRG, Hydraulic Control of Uranium Plume in Groundwater

A simulation of the complete removal of soils that exceed the Construction Worker risk (or Soil CW-PRG) was accompanied by features designed to hydraulically control the uranium plume from migrating to potential off-site receptors. The model was assembled to predict the groundwater reaction to the remedy and a timeframe for active controls (i.e., pumping).

Three vertical capture wells west of the inactive hazardous waste disposal site (two in the shallow zone and one in the deep zone) were augmented with an expanded rubblized trench that would hydraulically control groundwater flow and plume transport on the site. A rubblized trench is an extraction technology that is created by directionally blasting bedrock into highly permeable material to enhance the extraction of groundwater (i.e., create in-situ, high-permeability trenches in the bedrock). The rubblized trench technique provides a line sink in the groundwater system that is managed via pumping from sumps installed in the trench via large-diameter drilling techniques.

At Guterl, the rubblized trench is expected to prevent the off-site migration of uranium-impacted groundwater primarily in Layer 1 (shallow groundwater) in order to prevent the vertical spread of the uranium plume. The simulated trench in the Guterl model is 418 m (1370 ft) long and 7.3 m (24 ft) in depth and installed in Layer 1, with the bottom 7.6 cm to 15.0 cm (3 to 6 inches) into Layer 2.

The extraction rates for this alternative are summarized in Table 7-3 and partitioned the following way:

- A total of three (3) extraction wells and an expanded rubblized trench with a cumulative flow rate of 240 L/min (63.5 gpm) are modeled.

- Shallow Zone: Two extraction wells pumping at 26.5 L/min (7 gpm) and 19 L/min (5.0 gpm), with a cumulative flow rate of 45.5 L/min (~12 gpm); the estimated pumping rate for the trench is approximately 192 L/min (~51 gpm).

- Deep Zone: One extraction well with a rate of 2 L/min (0.5 gpm).

The uranium concentrations depicted over time in the shallow groundwater are shown on Figure 7-11, which indicates that the operation of vertical wells and the expanded trench produce a dewatered the area in the vicinity of the southern Site boundary to prevent further off-site plume migration. The uranium plume is fully captured along both the western and southern property boundaries throughout the simulation. The uranium plume is depleted below the MCL within approximately 500±5 years in the shallow zone.

The uranium concentrations in the deep groundwater are depicted on Figure 7-12 that shows the uranium plumes meets the MCL in approximately 580±5 years throughout nearly the entire site.

Results indicate that groundwater extraction with vertical extraction wells and a rubblized trench is a viable alternative for hydraulically controlling the off-site migration of the uranium plume for about 580 years until the MCLs are achieved in groundwater throughout the site.

In general, soil excavation to the Soil CW-PRG followed by hydraulic control of the uranium plume results in a decrease in the persistence of the uranium in groundwater as compared to the no action alternative, which does not include soil removal. The long attenuation period is due to the release of uranium mass remaining in the soil profile after the CW-PRG remedy was in place. During the 1,000 year evaluation period, the highest predicted groundwater concentration is 291 µg/L in shallow groundwater at year 90 approximately north of Building 2.

7.2.5 Soil Excavation to GW-PRG, Groundwater Extraction Using Vertical Wells and Rubblized Trench

Similar to the previous alternative, predictive modeling for this alternative was conducted to estimate the attenuation of the on-site and off-site uranium plume after the soil remedy is completed to the Soil GW-PRG level. Vertical wells in the main portion of the plume were augmented with a rubblized trench that would be used to extract the groundwater in the downgradient portion of the plume. A rubblized trench is an extraction technology that is created by directionally blasting bedrock into highly permeable material to enhance the extraction of groundwater (i.e., create in-situ, high-permeability trenches in the bedrock). The rubblized trench technique provides a line sink in the groundwater system that is managed via pumping from sumps installed in the trench via large-diameter drilling techniques. The rubblized trench is expected to prevent migration of groundwater off site, and also extracts the

uranium contaminated groundwater primarily in Layer 1 (shallow groundwater) in order to prevent the horizontal and vertical dispersion of the uranium plume. The simulated trench in the Guterl model is approximately 183 m (600 ft) long, 3 m (10ft) wide and 7.3 m (24 ft) in depth and installed in Layer 1, with the bottom 7.6 cm (3 inches) into Layer 2.

The extraction rates for this alternative are summarized in Table 7-4 and partitioned the following way:

- A total of 10 extraction wells and a rubblized trench with a cumulative flow rate of 296.8 L/min (~83 gpm) are modeled.

- Shallow Zone: Seven extraction wells with a range from 8 L/min to 26 L/min (2 gpm to 7 gpm) and a cumulative flow rate of total 134 L/min (35.5 gpm); the estimated pumping rate for the trench is approximately 162.8 L/min (43 gpm).

- Deep Zone: Three extraction wells a range from 3.8 L/min (1.0 gpm) to 9.5 L/min (2.5 gpm) with an estimated cumulative flow rate of 17.4 L/min [4.6 gpm].

The uranium concentrations depicted over time in the shallow groundwater are shown on Figures 7-13, which indicates that the operation of vertical wells and the trench produce a nearly site-wide remediation with 10 years of operation. Most specifically, the trench dewatered the area in the vicinity of the southern Site boundary to prevent further off-site plume migration. The uranium plume shrinks to within the southern property boundary towards the Erie Canal after approximately 25±5 years and attenuates to below the MCL within 30±5 years.

The uranium concentrations in the deep groundwater are depicted on Figures 7-14 that shows the MCL is met in approximately 30±5 years throughout nearly the entire site.

The modeling results indicate that groundwater extraction with vertical wells and a rubblized trench is a viable alternative for achieving MCLs in groundwater within 30 years throughout the majority of the site. During the 1,000 year evaluation period, the highest predicted groundwater concentration is 206 µg/L in the shallow groundwater at year 0, just underneath Building 37.

7.3 Modeling Limitations and Uncertainties

All models have application limitations and uncertainties in their predictions. The degree of representativeness of the modeling results is dependent on the following: 1) complexity of the site setting, 2) the amount of available site data, 3) the complexity of the model, 4) the effort expanded to adjust the model to site conditions, and 5) the scale of the model. The following sections discuss an uncertainty with extent of soil impacts along the northern and eastern

boundaries of the site and then other modeling conditions that may affect the simulations of uranium transport and fate.

7.3.1 Site Boundary Soil Uncertainty

The extent of soils above the Groundwater Protection and Construction Worker PRGs is illustrated in the main FS text (see FS Figures 3-1, 3-2, and 3-3) and indicates the CW-PRG soils are not common along the site boundaries. However, the extent of soils above the Groundwater Protection PRG surround the CW-PRG areas and abruptly end along the northern and eastern site boundaries. Off-site sampling was not performed along these boundaries since historical aerial photos (USACE 2009) show that property line was strictly maintained (i.e., site activities did not disturb or "spill into" adjacent properties).

The Baseline Risk Assessment (BRA) in the RI (USACE 2010) indicates that the CW-PRG is also protective of residential receptors who do not consume groundwater. Consequently, to assess whether unlikely off-site impacts at the CW-PRG along these boundaries would affect the GW-PRG alternatives, a "rind" of soils at the CW-PRG were allowed to leach at Soil Area 2 rates along the fenceline shown on Figures 7-15 and 7-16 (see yellow highlighted boundary). The "rind" is one model cell wide (nominally 50 x 50 feet) and was input to the simulation used to assess the MNA alternative derived from the GW-PRG soils alternative (Alternative G3).

The results of this simulation presented on Figures 7-15 and 7-16 show that the leachate from the "rind" of CW-PRG soils is adequately diluted by ambient groundwater and does not affect the plume fate associated with the soils GW-PRG. Consequently, the simulation of bordering soils at the CW-PRG does not pose a risk to the residential receptor nor elevate groundwater concentrations above the uranium MCL of 30 μg/L.

7.3.2 Numerical Modeling Uncertainty

The following is a list of general limitations and uncertainties associated with the model predictions presented in this Appendix.

1. A potential limitation to the model involves the simulation of the bedrock aquifer as an Equivalent Porous Media (EPM), which assumes the groundwater flow and solute transport conditions can be accurately replicated by an EPM model. An EPM model typically generalizes the fate and transport predictions. This is in contrast with a more complex discrete fracture model that might be constructed if detailed data on fracture widths, lengths, orientation, density, and connectivity were available. Since the EPM approach allows the plume to spread through the entire porous media (vertically integrated instead of migrating through individual fractures), it is capable of predicting the general plume migration on a large scale (i.e., bulk movement of the plume in the general flow direction, controlled by variability in hydraulic conductivities). The EPM

approach effectively allows the use of available data to predict the overall plume configuration over time (large scale plume movement), but is not efficient at making accurate predictions at individual monitoring wells. EPM models may under-estimate or over-estimate plume concentrations at individual locations, depending upon whether the well is in connection with transmissive fractures.

2. There is uncertainty with respect to the direction and magnitude of groundwater flow in the lower-most bedrock zone represented by Layer 3. Layer 3 does not contain monitoring wells, so groundwater elevations and hydraulic conductivities are not available. The layer provides a potential vertical exit path for groundwater from Layer 2. Observations from the two deep bedrock cores indicate that Layer 3 would have lower hydraulic conductivity due to a notable decrease in fracture density with depth. Based on the decreasing uranium concentration between Layers 1 and 2, the uranium concentrations are expected to be lower in Layer 3 (i.e., below the MCL). Consequently, the model was set up without a starting uranium plume in Layer 3, but allowed to transport uranium from Layer 2 into Layer 3. The actual transport into layer 3 is likely less robust than simulated since this sparsely fractured layer deviates significantly from the EPM assumption.

3. The model was constructed and calibrated to use the existing groundwater flow conditions, including to some extent the operation of dewatering at the quarry to the west. In the future, if the quarry operations cease, and the quarry is no longer dewatered, the groundwater flow field may be altered to account for this condition (e.g., the westerly flow along the western property boundary may reflect a more southerly direction as the dewatering influence is lost to Erie Canal influences).

4. There is uncertainty with respect to the assumption that the source of current and future uranium in groundwater is the leaching from the residual uranium in soil, and historic waste water disposal practices (such as unlined pits exposed to bedrock) no longer contribute to the groundwater uranium plume. It is possible that other historic sources are a contributing factor and may contribute additional uranium mass to the groundwater.

5. In addition to leaching of uranium from soil to groundwater, an additional flux of uranium to groundwater may occur from uranium bound to soil beneath the water table, where adsorption/desorption will control uranium release. This saturated-zone uranium was not included in the SESOIL leaching model and is not prevalent on site (i.e., most soil-based uranium is in the vadose zone). Consequently, this mass is ignored since it is limited in extent relative to the vadose-zone impacts that leach uranium to groundwater.

6. The selection of K_d values used in the soil leaching model was based on assessment of data from the RI and the DGI, which reported significantly different K_d values. The higher K_d values in the DGI than the RI likely occurred because of the different laboratory methods and the DGI samples were collected in uncontaminated areas of undisturbed native soils or areas with low uranium soil concentrations. Both data sets were used to produce an optimal K_d value for the soils leaching model.

7. The K_d values used in Layers 1, 2 and 3 of the groundwater model were the same, based on a single sample collected from Lockport dolomite and the geochemical profile (anionic uranyl carbonates). In reality, the K_d values may differ between the three model layers.

8. Although the general groundwater geochemistry supports the transport of dissolved uranium, the presence of the VOC plume may create local reductive conditions and potentially cause uranium to precipitate out of groundwater. A geochemical evaluation indicates that this is unlikely, and if it does occur, the impact on fate and transport will be transient, i.e., over a much shorter duration as compared to the 1,000 years period used for uranium fate and transport evaluation.

9. The model assumes that site structures are deteriorated and roofs allow rain water to infiltrate through soils under the buildings (i.e., the buildings do not restrict the leaching of uranium from soil into groundwater). In reality, it is possible that for a few decades out of the 1,000 year evaluation period, the buildings may restrict recharge for the no action alternative, resulting in reduction of leaching of uranium from soil to groundwater.

8.0 CONCLUSIONS

A summary of the soil and groundwater modeling performed and the conclusions reached are presented in the following bullets.

- Modeling of the fate and transport of uranium in soil and groundwater was conducted to include soil leaching, groundwater flow, and geochemical systems that were documented in the previous groundwater investigations conducted at the Site.
- The leaching of uranium from soil was simulated using SESOIL and configured to mimic five soil areas. For each of the soil areas, leachate concentrations were predicted for 1,000 years for three remedial scenarios:
  - No action – soils are left in place "as is,"
  - Soil Removal– soils exceeding the Soil CW-PRG are excavated and removed
  - Soil Removal – soils exceeding the Soil GW-PRG are excavated and removed.
- The Soil CW-PRG is defined as the maximum concentration of uranium in soil that will result in an acceptable risk of exposure to the construction worker.
- A Soil CW-PRG of 69 mg/kg total uranium (23 pCi/g 238U) was established as a threshold for soil removal to the Soil CW-PRG.
- The evaluation of soil for protection of construction worker also incorporates the condition that the SOR must also be less than or equal to 1.
- The Soil GW-PRG is defined as the concentration of uranium in soil that will be protective of groundwater; the excavation of soil impacted with uranium greater than the Soil GW-PRG, coupled with a separate groundwater plume remedial action, will ensure residual soil impacts will not re-contaminated the groundwater to concentrations greater than MCL (30 ug/L).
- A Soil GW-PRG of 11 mg/kg total uranium (3.66 pCi/g 238U) was established as a threshold for soil removal to the Soil GW-PRG.
- Soil leachate concentration (before dilution with groundwater) is expected to exceed the MCL for hundreds of years for the following actions:
  - No Action scenario shows peak concentrations for the five soil areas ranging from 281 µg/L to 35,280 µg/L occurring between 15 and 265 years from the present.

- Soil removal to the Soil GW-PRG produces peak leachate concentrations ranging from 36 µg/L to 93 µg/L occurring between 15 and 145 years from the present.
- Soil removed to the Soil CW-PRG produces peak concentrations ranging from 36 µg/L to 607 µg/L occurring between 15 and 235 years from the present.

- Soil leachate generated over time will contribute to the groundwater plume.
- A groundwater flow model was constructed and calibrated as a steady-state model.
- The model was divided into three layers:
  - Layer 1: Shallow groundwater bearing bedrock (fractured dolostone) that averages 6.7 m (22 ft) in thickness and 5.2 m (17 ft) in saturated thickness
  - Layer 2: Deep groundwater bearing bedrock (dolostone containing the first main fracture zone) that averages 11.6 m (38 ft) in thickness and is fully saturated
  - Layer 3: Shaly dolostone bedrock grading into shale that extends from the base of Layer 2 to approximately 24.4 m (80) ft below land surface, with an average thickness of 6.7 m (22 ft) and fully saturated.
- Model calibration statistics indicate that the model was capable of replicating field-observed groundwater flow conditions, with random calibration errors and no systematic biases in the model domain.
- Uranium transport models were created to evaluate the following FS alternatives:
  1. No Action
  2. Soil excavation to the Soil CW-PRG, MNA in groundwater, and LUCs
  3. Soil excavation to the Soil GW-PRG, MNA in groundwater, and LUCs
  4. Soil excavation to the Soil CW-PRG, Groundwater Extraction using Vertical Wells and a Rubblized Trench, Ex-Situ Treatment, and LUCs
  5. Soil excavation to the Soil GW-PRG, Groundwater Extraction using Vertical Wells and a Rubblized Trench, Ex-Situ Treatment, and LUCs
- For the No Action scenario, it was assumed that soils will be left in place and no groundwater treatment will be performed. The soil-based uranium is expected to continuously leach to groundwater for hundreds of years and sustain the groundwater

plume at concentrations above MCL for approximately 780±5 years in the shallow groundwater and over 1,000 years in the deep groundwater. The plume reaches a spatial and mass maximum in the two water-bearing zones between 350±5 and 430±5 years.

- The simulation of soil excavation to the Soil CW-PRG followed by MNA in groundwater results in a decrease in the persistence of the uranium plume compared to the no action alternative, which does not include soil removal. The predicted plume is expected to persist at concentrations above MCL for approximately 430±5 years in the shallow groundwater and approximately 660±5 years in the deep groundwater. The plume reaches a spatial and mass maximum in the two water-bearing zones between 50±5 and 100±5 years, respectively.

- The analysis of soil excavation to Soil GW-PRG followed by MNA in groundwater indicates uranium fate and transport that reflects source removal and pore-water flushing. A substantial decrease in the persistence of the site-wide uranium plume occurs with respect to the No Action and Soil CW-PRG alternatives. The predicted plume is expected to persist at concentrations above MCL for approximately 50±5 years in the shallow groundwater and approximately 120±5 years in the deep groundwater. The maximum plume is the current configuration, since the GW-PRG would promote plume attenuation after remedial action occurs.

- Modeling the Soil GW-PRG with an extraction-based technology (10 vertical wells and rubblized trench) ensures the uranium concentrations in on-site and off-site groundwater meet the MCL in less than 30 years after remedy was in place.

- The Soil CW-PRG coupled with hydraulic controls (three vertical wells and extended rubblized trench) is predicted to retain the plume on site until attenuation is completed around 500±5 years (shallow) and 580±5 (deep) years.

The FS of the FUSRP Guterl Site included five groundwater alternatives that would be coupled with soil and building material alternatives to assemble a selection of site-wide remedial alternatives that are later ranked for decision-making purposes in a Proposed Plan. The initial remediation costs and long-term maintenance and operation costs are included in the ranking assessment, along with an array of CERCLA criteria discussed in the main FS report.

Notes:

1. Use mid-range depth to water of 4.50 ft (54.0 inches) as SESOIL model bottom depth

2. NA denotes no sample obtained and corresponding Total Uranium value is an incremental average of the value between the 36-54 inch bgs (layer 2b) and the first available soil concentration below the vadose zone. Since no samples were collected for the 18 inch interval overlying the water table (36-54 inch bgs) it is assumed that the bottom 6 inch interval (48-54) has the same uranium concentration as the underlying 47.2 -70.9 inch interval (0.4 pci/g = 1.2 mg/Kg) and the intermediate layers (36-42 in bgs and 42-48 in bgs) were interpolated based on overlying and underlying layer concentrations.

Table 5-10

SESOIL Source Terms for Area 1 - Soil Excavation to PRG-GW Scenario
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Rules:

1 If the average soil ^{238}U activity excceds PRG-GW OF 3.66 pCi/g (11 mg/kg Total U), excavate and replace with backfill.

2 Backfill U = background 0.74 pCi/g ^{238}U (2.2 mg/kg Total U)

3 All soils overlying the lowest depth at which average soil ^{238}U activity excceds the PRG will be excavated.

Before Excavation

48	54	0	NA	NA	NA	NA	3	a	48	54	15.2

Notes:

Use mid range depth to water of 4.50 ft (54.0 inches) as SESOIL model bottom depth

Soil ^{238}U activity excceds PRG; soil to be excavated. Since no samples were collected for the 18 inch interval overlying the water table (36-54 inch bgs), it is assumed that the top 12 inches (36-36 inch bgs) will be excavated and backfilled while the bottom 6 inch interval (48-54) has the same uranium concentration as the underlying 47.2 -70.9 inch interval (0.4 pci/g = 1.2 mg/kg)and will be left in place.

No excavation

60	66	1	2.37	2.37	2.37	7.12	4	a	60	64.56	11.6

Notes:

Use mid range depth to water of 5.38 ft (64.56 inches) as SESOIL model bottom depth

Soil ^{238}U activity excceds PRG; soil to be excavated. No sample was collected at the depth interval 66-72 in bgs; however at underlying intervals there was high uranium. There were 2 samples reported from the 72-78 in bgs interval with 105 and 167 pCi/g 288U = 315 and 501 mg/kg U. The one reportable sample from the 78-84 in bgs interval had 39.2 pCi/g 288U = 117.7 mg/kg U. Excavation may be considered to depth 84 in bgs. This will eliminate the loading of residual uranium from the currently unexcavated 30-66 in bgs as well as leaching of uranium from soil in the smear zone, i.e., the 18 in. underneath the average water table that may be seasonally unsaturated.

No excavation

93 Max. Leachate concentration for the area.

Table 5-16

Soil Residuals for Area 1 - Soil Excavation Using PRG-CW Scenario
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Rules:

1. If the average soil ^{238}U activity exceeds PRG-CW OF 23 pCi/g (69 mg/kg Total U), and/or SOR >1, excavate and replace with backfill.
2. Backfill U = background 0.74 pCi/g ^{238}U (2.2 mg/kg Total U)
3. All soils overlying the lowest depth at which average soil ^{238}U activity exceeds the PRG-CW and/or SOR> 1 will be excavated.

Before Excavation

Top inches	Bottom inches	Sample Count	Average ^{238}U pCi/g	Average SOR	Minimum ^{238}U pCi/g	Maximum ^{238}U pCi/g	Total U mg/kg
0	6	26	2,016.21	92.32	0.00	30,286.00	`
6	12	18	1,104.47	51.96	0.00	4,550.00	3,316.72
12	18	10	406.36	18.02	0.00	2,428.00	1,220.30
18	24	2	389.50	16.93	378.00	401.00	1,169.67
24	30	0	251.05	10.98	NA	NA	753.89
30	36	2	112.59	5.02	1.17	224.00	338.11
36	42	0	56.63	2.50	NA	NA	170.07
42	48	1	0.68	-0.02	0.68	0.68	2.03
48	54	0	1.12	0.01	NA	NA	3.36
54	60	1	1.56	0.04	1.56	1.56	4.69
60	66	0	1.56	0.04	NA	NA	4.69

Notes:

1. Use mid range depth to water of 5.37 ft (64.4 inches) as approximate bottom depth for residual analysis.
2. Soil to be excavated because ^{238}U activity exceeds PRG-CW and/or SOR> 1 for this or a deeper depth increment.
3. No excavation necessary.
4. No sample was collected at the depth interval 24-30 in bgs; therefore the activity and SOR for this interval were estimated to be equal to the average of overlying (18-24 in bgs) and underlying (30-36 in bgs) increments.
5. No samples were collected at the depth intervals 36-42 in bgs, 48-54 in bgs and 60-66 in bgs. The activities and SORs for the intervals 36-42 in bgs and 48-54 in bgs were estimated by taking an average of the underlying and overlying soil increments. For the lowest depth increment of 60-66 in bgs, the activity and SOR were assumed to be same as the overlying increment.

After Excavation

Top inches	Bottom inches	Excavation to PRG-CW using average areal concentrations (DCGLw) as guide		Excavation to PRG-CW using not-to-exceed concentrations (DCGLemc) as guide	
		Average Residual ^{238}U pCi/g	Total Residual U mg/kg	Average Residual ^{238}U pCi/g	Total Residual U mg/kg
0	6	0.74	2.22	3.56	10.7
6	12	0.74	2.22	2.49	7.5
12	18	0.74	2.22	1.32	4
18	24	0.74	2.22	0	0
24	30	0.74	2.22	0.59	1.8
30	36	0.74	2.22	1.17	3.5
36	42	0.74	2.22	0.92	2.8
42	48	0.68	2.03	0.68	2

54	60	1.56	4.69	1.56	4.7
60	66	1.56	4.69	1.56	4.7

Notes:

1. DCGLw is the derived concentration guideline level, wide area. It represents the approach where excavation is guided by average areal concentration.
2. DCGLemc is the derived concentration guideline level, elevated measurement exposure concentration or never-to-exceed concentration. It represents the approach where excavation is guided by individual sample soil concentrations.

Table 5-17

Soil Residuals for Area 2 - Soil Excavation Using PRG-CW Scenario
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Rules:

1 If the average soil ^{238}U activity exceeds PRG-CW OF 23 pCi/g (69 mg/kg Total U), and/or SOR >1, excavate and replace with backfill.

2 Backfill U = background 0.74 pCi/g ^{238}U (2.2 mg/kg Total U)

3 All soils overlying the lowest depth at which average soil ^{238}U activity exceeds the PRG-CW and/or SOR> 1 will be excavated.

Before Excavation

60	66	14.33	43.03	4.10	12.3
66	72	2.53	7.61	2.53	7.6

Notes:

1. DCGLw is the derived concentration guideline level, wide area. It represents the approach where excavation is guided by average areal concentration.
2. DCGLemc is the derived concentration guideline level, elevated measurement exposure concentration or never-to-exceed concentration. It represents the approach where excavation is guided by individual sample soil concentrations.

Table 5-18

Soil Residuals for Area 3 - Soil Excavation Using PRG-CW Scenario
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Rules:

1 If the average soil ^{238}U activity exceeds PRG-CW OF 23 pCi/g (69 mg/kg Total U), and/or SOR >1, excavate and replace with backfill.

2 Backfill U = background 0.74 pCi/g ^{238}U (2.2 mg/kg Total U)

3 All soils overlying the lowest depth at which average soil ^{238}U activity exceeds the PRG-CW and/or SOR> 1 will be excavated.

Before Excavation

Top inches	Bottom inches	Sample Count	Average ^{238}U pCi/g	Average SOR	Minimum ^{238}U pCi/g	Maximum ^{238}U pCi/g	Total U mg/kg
0	6	51	603.43	26.48	0.64	23,500.00	`
6	12	12	97.05	4.47	2.11	465.00	291.44
12	18	14	45.00	2.11	5.90	268.00	135.14
18	24	2	9.98	0.35	3.46	16.50	29.97
24	30	2	13.46	0.57	1.61	25.30	40.42
30	36	13	22.34	0.97	1.39	159.00	67.09
36	42	0	11.37	0.47	NA	NA	34.14
42	48	0	11.37	0.47	NA	NA	34.14
48	54	0	11.37	0.47	NA	NA	34.14

Notes:

1. Use mid range depth to water of 4.50 ft (54.0 inches) as approximate bottom depth for residual analysis.

2. Soil to be excavated because ^{238}U activity exceeds PRG-CW and/or SOR> 1 for this or a deeper depth increment.

3. No excavation necessary.

4. Since no samples were collected for the 18 inch interval overlying the water table (36-54 inch bgs), this interval was assigned ^{238}U activity and SOR estimated by averaging the data from the overlying layer (24-30 in bgs) and the next sample below the water table (47.2 to 70.9 in bgs)

After Excavation

Top inches	Bottom inches	Excavation to PRG-CW using average areal concentrations (DCGLw) as guide		Excavation to PRG-CW using not-to-exceed concentrations (DCGLemc) as guide	
		Average Residual ^{238}U pCi/g	Total Residual U mg/kg	Average Residual ^{238}U pCi/g	Total Residual U mg/kg
0	6	0.74	2.22	7.84	23.5
6	12	0.74	2.22	7.65	23.0
12	18	0.74	mg/kg	10.72	mg/kg

42	48	0.74	2.22	17.06	51.23
48	54	0.74	2.22	1.07	3.22

Notes:

1. DCGLw is the derived concentration guideline level, wide area. It represents the approach where excavation is guided by average areal concentration.
2. DCGLemc is the derived concentration guideline level, elevated measurement exposure concentration or never-to-exceed concentration. It represents the approach where excavation is guided by individual sample soil concentrations.

Table 5-20

Soil Residuals for Area 5 - Soil Excavation Using PRG-CW Scenario
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Rules:

1 If the average soil ^{238}U activity exceeds PRG-CW OF 23 pCi/g (69 mg/kg Total U), and/or SOR >1, excavate and replace with backfill.

2 Backfill U = background 0.74 pCi/g ^{238}U (2.2 mg/kg Total U)

3 All soils overlying the lowest depth at which average soil ^{238}U activity exceeds the PRG-CW and/or SOR> 1 will be excavated.

Before Excavation

Top inches	Bottom inches	Sample Count	Average ^{238}U pCi/g	Average SOR	Minimum ^{238}U pCi/g	Maximum ^{238}U pCi/g	Total U mg/kg
0	6	18	7.33	0.29	2.38	18.20	`
6	12	6	16.75	0.73	1.65	78.50	50.300
12	18	2	3.40	0.27	2.93	3.87	10.217
18	24	0	5.33	0.29	NA	NA	16.010
24	30	3	7.26	0.30	6.39	8.14	21.802
30	36	3	2.98	0.09	0.97	5.46	8.949
36	42	0	2.68	0.10	NA	NA	8.037
42	48	0	2.68	0.10	NA	NA	8.037
48	54	0	2.68	0.10	NA	NA	8.037
54	60	0	2.68	0.10	NA	NA	8.037
60	66	1	2.37	0.10	2.37	2.37	7.125

Notes:

1. Use mid range depth to water of 5.38 ft (64.56 inches) as approximate bottom depth for residual analysis.

2. Soil to be excavated because ^{238}U activity exceeds PRG-CW and/or SOR> 1 for this or a deeper depth increment.

3. No excavation necessary.

4. No samples were collected at the depths 18-24 and 36-60 in bgs. The activities for these depth intervals were estimated by taking an average of the underlying and overlying soil increments.

After Excavation:

Top inches	Bottom inches	Excavation to PRG-CW using average areal concentrations (DCGLw) as guide		Excavation to PRG-CW using not-to-exceed concentrations (DCGLemc) as guide	
		Average Residual ^{238}U pCi/g	Total Residual U mg/kg	Average Residual ^{238}U pCi/g	Total Residual U mg/kg
0	6	7.33	mg/kg	7.56	mg/kg
6	12	16.75	50.30	4.40	13.21
12	18	3.40	10.22	3.40	10.21
18	24	5.33	16.01	5.33	16.01

Table 6-1

Calibrated Flow Model Input Parameters
(Model Run Base_61)
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Parameter	Value
Horizontal Discretization of Model Grid	
Number of rows	155
Number of columns	120
Model cell dimensions	50 feet x 50 feet
Vertical Discretization of Model Grid	
Number of layers	3
Total number of model cells	55,800
Total number of active model cells	39,149
Average saturated thickness - Layer 1	17
Average saturated thickness - Layer 2	38
Average saturated thickness - Layer 3	32
Hydraulic Conductivity, ft/day	
Layer 1 range	5.7 to 69.9
Layer 1 Geometric Mean	20.5
Layer 2 range	0.1 to 53.3
Layer 2 Geometric Mean	1.8
Layer 3 range	0.1
Layer 3 Geometric Mean	0.1
Anisotropy	
Horizontal anisotropy - all layers	1.0
Vertical anisotropy	1.0
Recharge, inches/year	
Highest active cell	15
Calibration Target	
Target groundwater elevation measurement date	August 3, 2011
Number of calibration targets - Layer 1	40
Number of calibration targets - Layer 2	11
Boundaries	
Model Top	Recharge
Erie Canal, Model Layers 1 and 2	River
Quarries	General Head
Between Site and Quarries, Model Layer 1	Specified Head
Model East Boundary, Layer 1	Specified Head
All other boundaries	Open, Variable Head
Model Bottom	No Flow

Model Error Statistics

Range of observed heads	35.98	ft	
Mean Residual (Head)	0.18	ft	0.51%
Mean Absolute Residual (Head)	2.68	ft	7.45%
Root Mean Squared Residual (Head)	4.32	ft	12.01%

Note: Percent errors were calculated by dividing the individual errors in feet by the range of hydraulic heads observed across the site and multiplying the resultant fraction by 100.

Table 7-2

Feasibility Study Alternative Analysis Results
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

Feasibility Study Alternative	Expected Plume Duration Above MCL, Years	
	Shallow Groundwater	Deep Groundwater
No Action	780 ± 5	1000+
Monitored Natural Attenuation, after removal of soil exceeding CW-PRG (69 mg/kg total uranium) and/or sum of ratios (SOR) is greater than 1	430 ± 5	660 ± 5
Monitored Natural Attenuation, after removal of soil exceeding GW-PRG (11 mg/kg total uranium)	50 ± 5	120 ± 5
Groundwater Control using Vertical Wells and Rubblized Trench Coupled with CW-PRG	500 ± 5	580 ± 5
Groundwater Recovery using Vertical Wells and Rubblized Trench Coupled with GW-PRG	30 ± 5	30 ± 5

Notes:

1. The PRG-GW is defined as the concentration of uranium in soil that will be protective of groundwater such that if all soil impacted with uranium greater than the PRG-GW were excavated, and the current groundwater plume was addressed through a separate remedial action over a 30-year time frame, future leaching of uranium from the residual soil would not result in regrowth of a uranium plume (uranium concentrations greater than MCL) after 30 years of groundwater remedy implementation.

2. The PRG-CW is defined as the maximum concentration of uranium in soil that will be result in acceptable risk of exposure to construction worker from residual radioactivity in soil after soils impacted with uranium greater than the PRG-CW were excavated.

2. The SOR method is based on the principle that a ratio greater than 1 represents unacceptable exposure and a ratio less than or equal to 1 represents acceptable exposure; if there are multiple radionuclides in the medium being evaluated, the sum of the ratios for all of the radionuclides must also be less than or equal to 1. For the construction worker evaluation, SOR values were generated using the PRGs developed by USACE for ^{238}U and for ^{232}Th.

Table 7-3

Flow Rates for Hydraulic Control with Vertical Wells and Rubblized Trench
Former Guterl Specialty Steel Corporation FUSRAP Site
Lockport, New York

LEGEND:

- MONITORING WELL
- WATER LEVEL, AUGUST 2011
- SCREENED INTERVAL
- BOTTOM OF BORING
- 23 FRACTURES / RQD (%)
- OVERBURDEN SOIL
- FRACTURED DOLOSTONE, RQD <80% SHALLOW FLOW ZONE
- DOLOSTONE, RQD >80%
- SHALEY DOLOSTONE
- FIRST MAIN FRACTURE ZONE AND DEEP GROUNDWATER ZONE

ZONE OF GREATER FRACTURES CONTAINED WITHIN LOWER FRACTURE ROCK THAT IS NOT OBSERVED IN ADJACENT BORINGS.

NOTES

1) CANAL WATER LEVEL AND BOTTOM REFERENCED FROM AUGUST 2011 GAUGE READING AT LOCK 35, APPROXIMATELY 1.75 MILES DOWNSTREAM.

2) RQD=ROCK QUALITY DESIGNATION. A DEGREE OF FRACTURING IN A ROCK CORE (%) WHERE THE VALUE IS INVERSELY RELATED TO LENGTH OF ROCK BROKEN BY FRACTURES. FEW FRACTURES HAVE HIGH RQD% (FEW BLUE DASHES), MULTIPLE FRACTURES (MANY BLUE DASHES) HAVE LOW RQD%.

Attachment B

In Situ Transducer Data Analysis

ATTACHMENT B

In Situ Groundwater-Quality Sonde and Level-Logger Data Comparison

Water-quality sonde and water-level logger data were graphed against time to assess data trends and relationships. The following techniques was employed and illustrated on the subsequent trend graphs:

- Groundwater Levels were plotted with Temperature Data
- Specific Conductance was plotted with Temperature and Groundwater Levels
- Groundwater Levels were plotted with Precipitation
- Temperature was plotted for multiple well couplets (shallow and deep groundwater zones) and for wells along a groundwater flow path through the central portion of the site

Data relationships and hydrogeologic characteristics indicate the following:

- Groundwater Levels and Temperature:
  - An inverse relationship occurs between water levels and temperature due to seasonal recharge periods when winter temperatures and spring recharge cools the groundwater that later warms during the summer months when the ground absorbs heat and warms available recharge (excess soil moisture).
  - A more subdued inverse to nearly proportional relationship occurs between water levels and temperature due to the lag time that is evident in the temperature variations between the shallow and deep zone.
- Specific Conductance and Groundwater Levels:
  - Specific conductance shows a weak inverse relationship with water levels due to dilution from groundwater recharge (lowers conductance) that also includes dissolved constituents from the leaching of soil minerals (raises conductance and uranium influx) from the thin vadose zone.
  - Specific conductance data were not plotted for the deep zone since the sonde data do not appear characteristic of natural trends, indicating the conductance sensors may have malfunctioned.
- Groundwater Levels and Precipitation:
  - Water-level versus precipitation trends for six wells (four are shallow/deep couplets) indicate a rapid recharge response occurs with precipitation in both zones (shallow and deep), which indicates a very good hydraulic connection between the zones.
- Inter-well Temperature:
  - Temperature data from the shallow zone exhibit a greater range (fluctuation) than the deep zone.
  - Temperature in each zone shows a near uniform variation in range and frequency (i.e., the high land low periods are coincident in the shallow zone).
  - The temperature high and low periods are offset (or lag each other) by approximately three (3) months in each zone, which indicates the vertical travel time between the two zones for seasonal temperature pulses and logically uranium migration. Well couplets closer to the canal show a shorter lag (1-2 months) likely due to the greater vertical connections derived from gradient changes near the canal and rock disturbance during Erie Canal construction (e.g., blasting may have enhanced natural fracturing).
  - The dampened response (data range) in the deep zone indicates both the attenuation of the temperatures by the host dolostone (i.e., the heat capacity of the bedrock lessens the temperature range) and a limited vertical migration of the shallow-zone plume.

Conclusion

The water-quality sonde and level-logger data re-inforce the conceptual model of uranium transport from soils by illustrating that soil-based minerals (and collocated contaminants) transfer to the groundwater via seasonal recharge, as evident in specific conductance, temperature, water-level, and precipitation data. The vertical interconnection of the shallow and deeps zones appears to have a three-month lag time as evidenced by temperature data.

Uranium Flux

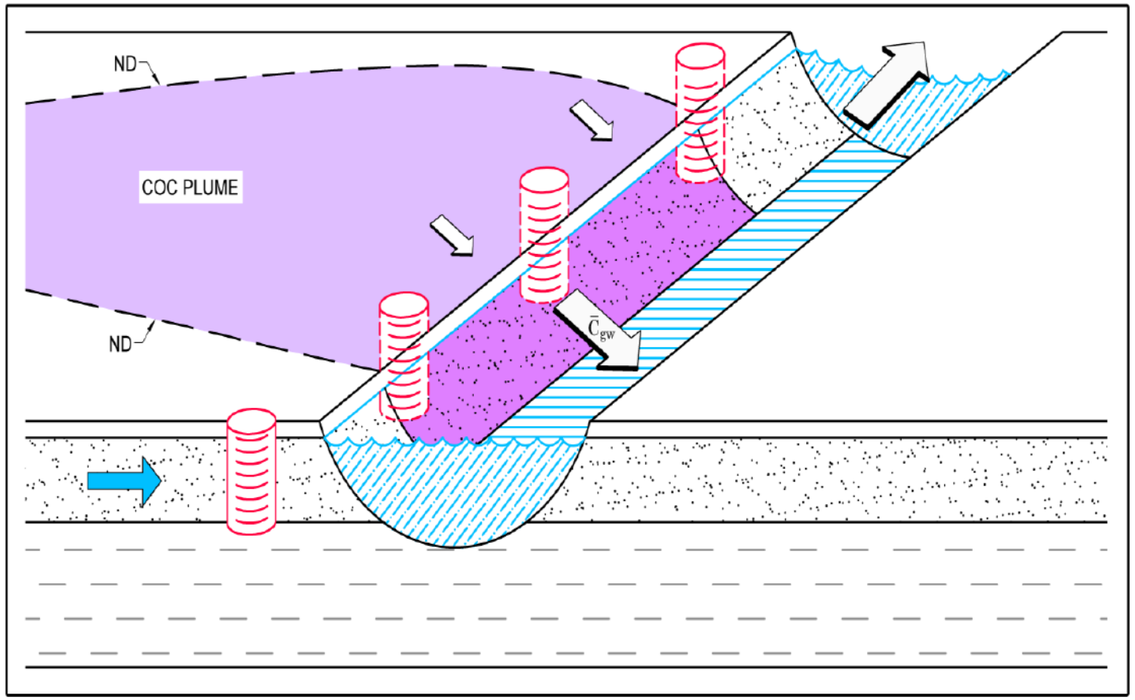
Analysis

ATTACHMENT C

Groundwater Flow and Uranium Flux Calculation for Discharges to the Erie Canal

Method Reference: Texas Commission on Environmental Quality (TCEQ), 2013. Determining Representative Concentrations of Chemicals of Concern for Ecological Receptors. RG-366/TRRP-15eco, November 2013.

For the calculation of ecological protective of surface water when groundwater is the source medium, it is necessary to determine a representative groundwater concentration that is discharging from a plume to a surface-water body or conveyance. The method and calculation referenced above uses a bulk value for groundwater discharge and concentration entering into and mixing with a surface water body. However, groundwater COC concentrations are not uniform along the groundwater–surface water interface and groundwater monitoring well networks along the interface usually are not spatially suitable to determine a representative groundwater concentration by arithmetic averaging. Therefore, a discharge-weighted averaging procedure is recommended for determining a site-specific representative groundwater concentration. The adjacent figure provides a general pathway schematic (TCEQ 2013).



The input data are generally known at Guterl and include the following; the input locations and data are presented on Figures C-1, C-2, and C-3:

Input Parameter	Shallow Zone	Deep Zone
Inter-well Distance (ft)	Location Specific	Location Specific
Well Concentration (mg/L)	Well-specific Uranium	Well-specific Uranium
Hydraulic Conductivity (cm/s)	Well-specific Value or Average	Layer Average
Hydraulic Gradient (ft/ft)	0.007	0.007
Effective Porosity	0.10 (10%)	0.05 (5%)
Saturated Thickness (ft)	17.0 (Layer Average)	38 (Layer Average)

The groundwater gradient and concentrations are derived from 2015 sampling data, which was used since all wells were sampled in 2015.

Groundwater Discharge Concentration

The groundwater discharge rate for the shallow zone is estimated at 0.00532 cubic feet per second (cfs) (2.4 gallons per minute [gpm]), while the deep zone is 0.000362 cfs (0.156 gpm).

The representative groundwater concentrations discharging through the subsurface “picket line of wells” towards the Erie Canal are 50 ug/L in the shallow zone and 29 ug/L in the deep zone. This does not account for additional dispersion and groundwater dilution that may occur as these concentrations approach the Erie Canal seepage area.

These estimates are similar to uranium concentrations observed seeping from the rock face of the canal, where uranium concentrations vary between 0.9 ug/L and 44.9 ug/L, have a mean of 20.3 ug/L, and geometrically average 12.3 ug/L. Consequently, the calculated estimates and observed conditions fall within a similar range, with the observed seepage data reflecting some uranium dilution (or dispersion) as it migrates towards the canal. Considering the stability of the plume (noted in Appendix A), this condition should persist into the near future (possibly 10 years) and thus not grossly change during the project life cycle (i.e., lead up to remedial action).

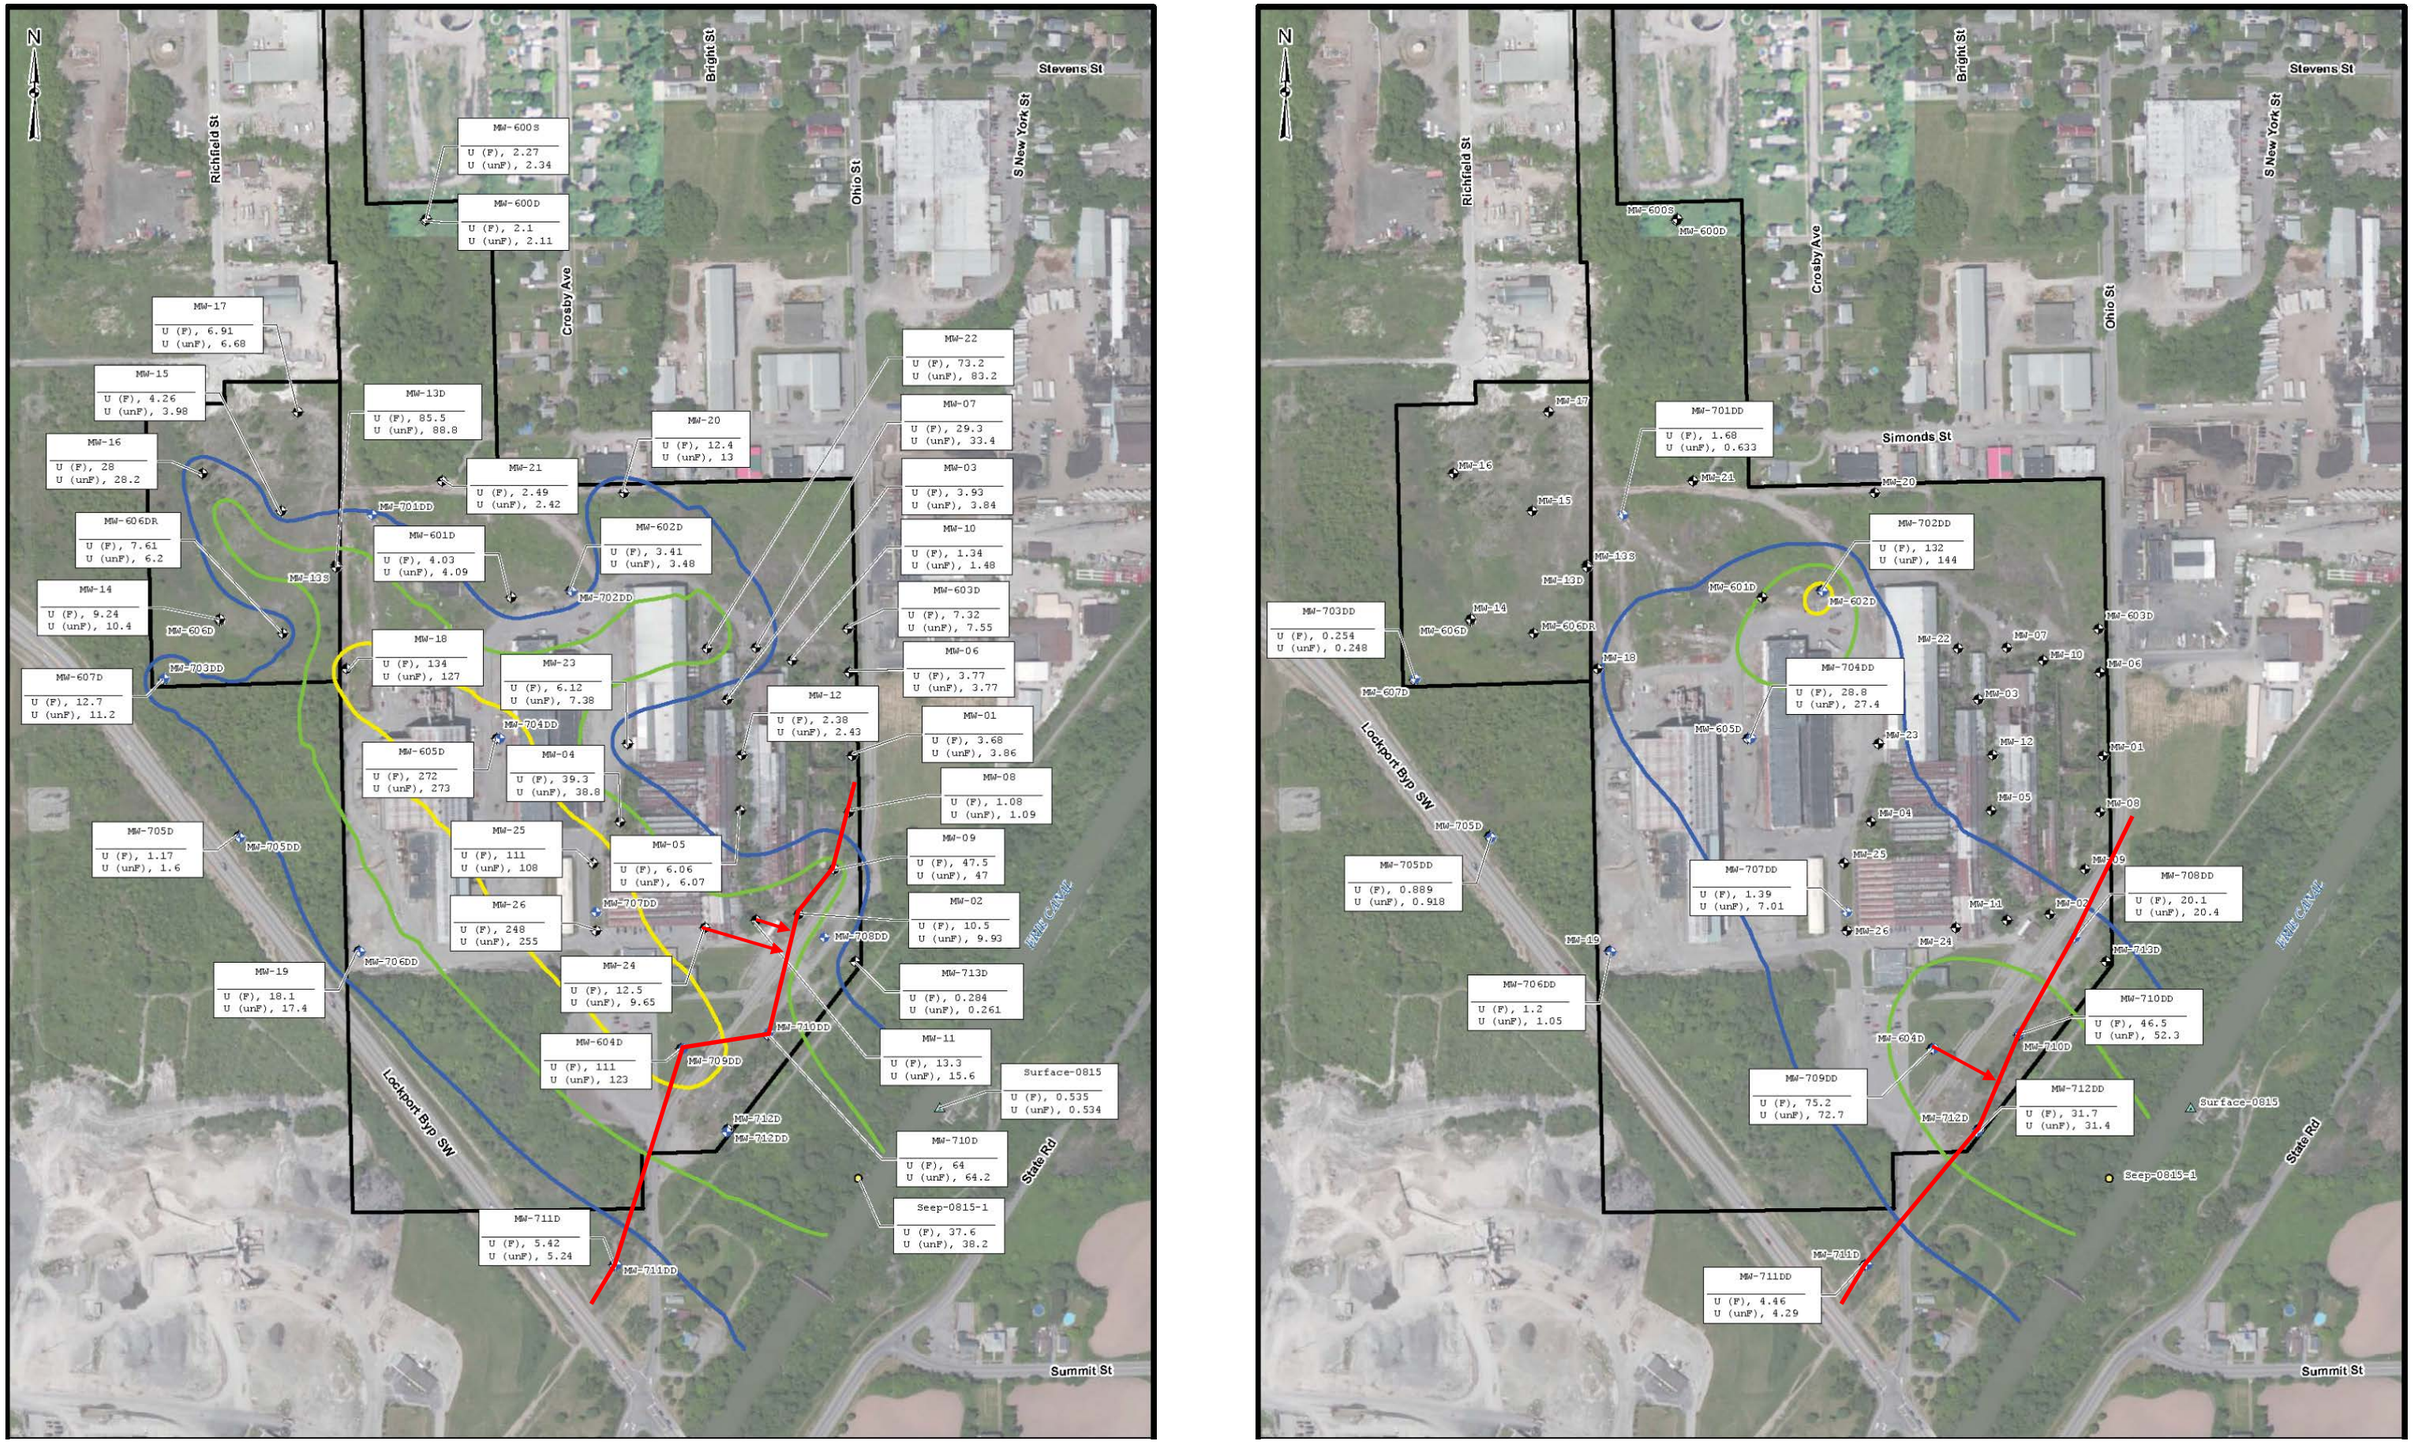


Figure C-1: Groundwater Discharge and Uranium Flux Cross-section Locations in Shallow and Deep Aquifers

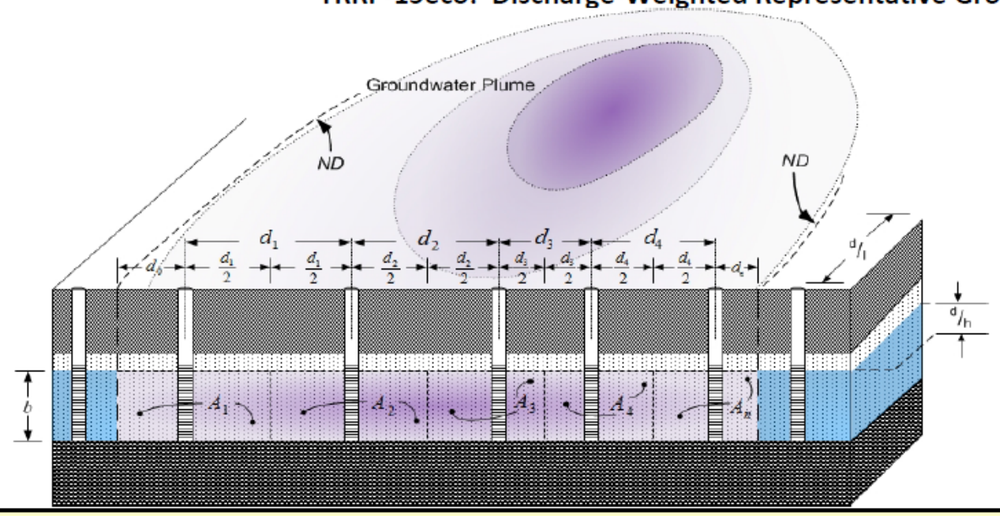
TRRP-15eco: Discharge-Weighted Representative Groundwater COC Concentration at Surface Water Interface (v. 1.2 Oct 2012)



INSTRUCTIONS:

1. Calculator solves general condition described in [EQ 12], below
2. Enter data only in uncolored cells
3. BEGIN by entering monitoring well designations starting with "Well 1," and consistent with the order presented in Figure D.2 (Appendix D, TRRP-15eco) and reproduced here - Up to 10 groundwater/surface water interface monitoring wells may be entered
4. Enter distances as shown in Figure D.2 (Appendix D, TRRP-15eco)
5. Enter remaining COC and aquifer parameter data from each respective monitoring well
6. Enter values IN UNITS DENOTED
7. Representative groundwater concentration displayed in blue box at bottom
8. DELETE DATA IN COLUMNS WITH NO WELL DESIGNATION

(table below contains example D.1 information - replace with site well information)

$$\overline{C}_{gw} = \frac{C_{gw_1} K_1 \frac{dh}{dl_1} \eta_{e_1} \left(d_0 + \frac{d_1}{2} \right) b_1 + \sum_{i=2}^{n-1} \left(C_{gw_i} K_i \frac{dh}{dl_i} \eta_{e_i} \left(\frac{d_{i-1} + d_i}{2} \right) b_i \right) + C_{gw_n} K_n \frac{dh}{dl_n} \eta_{e_n} \left(\frac{d_{n-1}}{2} + d_n \right) b_n}{K_1 \frac{dh}{dl_1} \eta_{e_1} \left(d_0 + \frac{d_1}{2} \right) b_1 + \sum_{i=2}^{n-1} \left(K_i \frac{dh}{dl_i} \eta_{e_i} \left(\frac{d_{i-1} + d_i}{2} \right) b_i \right) + K_n \frac{dh}{dl_n} \eta_{e_n} \left(\frac{d_{n-1}}{2} + d_n \right) b_n} \quad \text{[EQ 12]}$$

THF(i) is the thread fraction of the parent nuclide.

RESCALC.EXE execution time = 8.63 seconds

Guterl FS Appendix G, Table 2

Use of RIR RESRAD Runs for Residential Receptor:

EXCEPTIONS: Drinking water pathway is turned off

Resident assumed to consume only water with up to MCL's worth of U (30 ug/L ~ 5 mrem/year)

Soil exposure pathways limited to 20 mrem/year

	Area = 10,000 m2	
Isotope	DSR	**PRG**
	all time 0 (mrem/year per pCi/g)	(pCi/g)
U234	0.0269	743
U235	0.4122	49
U238	0.102	196
Total U pCi/g		**277**
U-238 as total U surrogate		135
Total U mg/kg		*406*

Th-23 DCGL	DSR t=0	**PRG**
	(mrem/year per pCi/g)	
Th-232		pCi/g
Ra-228	5.03	
Th-228	4.378	
Th-232	0.4518	
sum Th-232 + daughters	9.8598	**2.0**

Definitions:
DSR Dose to Source Ratios, developed in RESRAD
PRG Preliminary remediation goal

RESRAD-BUILD: Buildings

Building Surface Derived Concentration Guideline Levels and Derived Concentration Guideline Level Equivalents for Measurement

Former Guterl Specialty Steel Corporation

FUSRAP Site

October 22, 2014

1.0 Introduction

Derived Concentration Guideline Levels (DCGLs) for building surfaces and the DCGL Equivalents for particulate radiation measurements were calculated for the Guterl FUSRAP Project.

2.0 Methodology

The calculation of DCGLs for Guterl buildings were performed using the "RESRAD-BUILD, Version 3.5" computer code developed by the Environmental Assessment Division of Argonne National Laboratory. This widely used program calculates radiological doses to human receptors in buildings contaminated with radioactive material.

Doses were calculated for use as unit dose factors for each of the project radioactive materials of concern (ROCs); ^{234}U, ^{235}U, ^{238}U, ^{230}Th, ^{232}Th, and ^{226}Ra. Existing ratios of these nuclides at Guterl Steel were derived from data from the *Guterl Remedial Investigation (RI) Report* using only significantly elevated "soils in buildings" data. Based on these ratios, provided in Table 1, appropriate weighting was given to the contributions of each of the individual radioactive materials to particulate measurement of surface contamination.

Table 1: Radionuclide Distribution Relative Activity

Radionuclide	^{234}U	^{235}U	^{238}U	^{230}Th	^{232}Th	^{226}Ra	Total
Relative Activity	0.48	0.03	0.48	0.0003	0.010	0.0002	1.000

*Data from the Remedial Investigation Report Former Guterl Specialty Steel Corporation; Tables 3-9, 3-10, and 6-3.

Alpha and beta decay scheme particulate emissions were calculated for each of the ROCs and are provided in Table 2. Since beta measurement is preferred over other radiations for direct surface contamination measurement, due mainly to the physical properties of the emissions and self-absorption issues associated with direct measurement of alpha particles, DCGL equivalents for direct measurement were developed for surface beta emission rates, i.e. betas/minute/100 cm^2. For removable activity DCGLs having similar units of emissions/minute/100 cm^2 for both alpha and beta radiations were developed because, on a smear, alpha contamination is more easily measured (lower self-absorption) than on building surfaces.

Table 2: Alpha and Beta Emissions per Disintegration

Radionuclide	α/d	β/d
^{234}U	1	0
^{235}U	1	1
^{238}U	1	2
^{230}Th	1	0
$^{232}Th+D$	7	3
^{226}Ra	1	0

Notes:
D= Daughters
d= disintegrations

The main contribution to dose and particulate emissions for DCGL and DCGL Equivalent for Measurement development is due to the uranium nuclides, which constitute the majority of activity found at the site. Contributions from the remaining ROCs were much less significant.

Three potential critical groups were analyzed, as in the RI Risk Assessment, the on-site worker, the construction worker and the juvenile trespasser. The on-site worker is modeled here as an office worker or assembly line worker working an 8-hour day for a year. The construction worker is modeled in a 3-month renovation scenario and the juvenile trespasser is occasionally present at the site for a limited duration during the year. The project DCLGs and DCGL Equivalent for Measurement represent the most restrictive contamination levels for any of these potential critical groups. Exposure pathways in RESRSAD-BUILD included:

1. External exposure to radiactive materials and submersion in airborne radioactive particulates.
2. Inhalation of airborne radioactive particulates and radon decay products.
3. Ingestion of radioactive materials from the source and building surfaces.

Dose modeling and nuclide intake unit dose factors used ICRP 60 methodology. The single receptor was placed in the center of an area of surface contamination and dose was calculated at a height of 1 meter above the surface. A single room, area 36 m^2, was assumed since many "small" rooms are present at the site within the relatively large production buildings. Various input parameters were chosen for the code including a combination of default RESRAD-BUILD and site-specific parameters along with the rationale for use are provided in Table 3. For removable contamination DCGL the removable fraction was assumed to be 1.

Table 3: Buildings Input Parameters for DCGLs

	Guterl Buildings Input Parameters for DCGL						
	Parameter	Units	OW	CW	JT	RESRAD Default	Rationale and assumptions used
Time	Exposure duration	days	365	90	10	365	RESRAD-Build default value for year long dose assessment is 365 days; 30 days assumed for CW for building renovation; assumed 10 d/yr for JT
	Indoor fraction		0.23	0.351	0.42	0.5	RESRAD-BUILD User's Manual Ver 3, Section J.1.2; Assumed OW- 2000 hr/8760 hr/yr = 0.23; CW - 8.4 hr/d spent working for 90 days = 0.351 ; JT - 10 hr/d for 10 d/yr = 0.42
	Evaluation time	days	0	0	0		Beginning time for the exposure duration. Maximun dose at time = 0
	Time integration		17	17	17	17	RESRAD-Build default value
Building	Number of rooms		1	1	1	1	A single room is modeled to approximate small room in large building
	Deposition velocity	m/s	0.01	0.01	0.01	0.01	RESRAD-Build default value
	Resuspension rate	1/s	5.00E-07	5.00E-07	5.00E-07	5.00E-07	RESRAD-Build default value
	Building exchange rate	1/h	1	1	1	0.8	If building was renovated 1 exchange/hr is reasonable. Juvenile trespasser in building conservatively estimated for current condition
	Room area	m^2	36	36	36	36	RESRAD-Build default value
	Room height	m	3.05	3.05	3.05	2.5	Estimated to be 10 feet for a small room
	Shielding thickness	cm	0	0	0		Surface contamination - no shielding assumed
Receptor	Number of receptors		1	1	1	1	RESRAD-Build default value
	Room number		1	1	1	1	RESRAD-Build default value
	Time fraction		1	1	1	1	RESRAD-Build default value and maxium exposure fraction
	Breathing rate	m^3/d	33.6	38.4	33.6	18	NUREG/CR-5512 Vol 1 Sec 6.7.2 & Table 6.23 & RESRAD-BUILD User's Manual, Ver 3 (Section J.3.5); 33.6 m3/d (1.4 m^3/hr), 38.4 m^3/d (1.6 m^3/hr)
	Ingestion rate - indirect	m^2/h	1.00E-04	1.00E-04	1.00E-04	1.00E-04	RESRAD-Build default value
	Location x,y,z	m	5,5,1	5,5,1	5,5,1	1,1,1	Location variables place receptor in center of contaminated area
Source	Source number		1	1	1	1	Single source assumed
	Room number		1	1	1	1	Single room assumed
	Type area, volume, etc		area	area	area		Circular area with no thickness assumed for modeling surface contamination
	Direction		Z	Z	Z	X	Receptor is standing on contaminated surface
	Location x,y,z	m	5,5,0	5,5,0	5,5,0	0,0,0	Location variables place receptor in center of contaminated area
	Area	m^2	36	36	36	36	RESRAD-Build default value; area source is equal to area of room
	Air release fraction		0.357	0.1	0.357	0.1	RESRAD-Build default value
	Direct ingestion	1/h	0.00E+00	0.00E+00	3.06E-06	0.00E+00	Source and receptor co-located; RESRAD-BUILD User's Manual Ver 3, Table 3.1
	Removable fraction		0.1	0.1	0.1	0.5	NRC NUREG-1757 - 10% activity assumed removable; RESRAD-BUILD User's Manual Ver 3, Figure J.14 DOE most likely value. For removable contamination this factor was changed to 1.
	Lifetime (time of source removal)	days	10,000	90	10,000	365	RESRAD-BUILD User's Manual Ver 3, Section J.4.10 most likely value 10,000 (27.4 yr); entire area source removed during 90 day renovation for CW
	Radon release fraction		0.9	0.9	0.9	0.1	Source is a thin layer of contamination
	Contamination	dpm/m^2	100	100	100	>0	Calculated unit dose based on this arbitrary value
	Source erosion rate	cm/d	NR	NR	NR	2.40E-08	Does not apply to area source
	Radon effective diffusion coefficient		NR	NR	NR	2.00E-06	Does not apply to area source
	Radon emanation fraction		NR	NR	NR	0.2	Does not apply to area source
Notes:	OW = On-site (office) worker; CW = Construction worker; JT = Juvenile trespasser						

3.0 Results

Data sheets presenting the DCGLs, for each direct measurement worker scenario, and for the removable contamination (limited by the construction worker) are included in Table 4. The print outs from RESRAD-BUILD computer runs are provided as in Appendix A. The calculated DCGLs are listed in Table 6. Table 7 converts the calculated surface DCGLs to DCGL Equivalent for Measurement for beta activity measurement assuming a 2 π geometry (50% reduction of surface betas) and a beta backscatter factor (increase in the "forward" direction of the percent of betas emitted in the "downward direction") assumed to be 20% (estimated from backscatter graphs) or a backscatter factor of 1.2. The backscatter of alphas is much less than that for betas and the assumed alpha backscatter factor is 1.0 . Appendices include the printouts from the RESRAD-BUILD runs.

The critical group is determined from the above methodology to be the construction worker.

Total Beta Level (β/min/100 cm^2)	Total Alpha Level (α/min/100 cm^2)
1509	1195

Notes:

1. Backscatter factor is assumed to be 1.2. (Graph "%backscatter vs. atomic" "Principles Radioisotope Methodology" 3rd Ed. P. 131 for range expected X of media and energies of beta particles 20& backscattering is appropriate and the backscatter factor (BF) would be 1.2)
2. Graph
3. It is expected that half the surface betas will be mitted in the direction of the detector and a reading higher by the BF will be due to backscattered betas from the surface.
4. It is expected that half the surface alphas will be emitted in the direction of the detector and no significant backscatter will occur.
5. Predominantly ^{238}U betas at 0.188MeV @.73/d and 2.28 MeV @.99/d

For comparison purposes the surface contamination limits from USACE EM-385-1-80 were recalculated to units of betas/minute/100 cm^2 for removable, total, and maximum limits, using the same nuclide ratios assumed above and are provided in Table 7. These values are provided only for comparison to the values calculated by RESRAD-BUILD above.

APPENDIX I

Contaminated Soil Volume Estimate
Guterl FUSRAP Site

1.0 Estimated Volume of Material Requiring Remediation

The USACE Buffalo District developed estimates of FUSRAP-contaminated soil at the Guterl Site for use in the detailed analysis of alternatives. This estimation was used to develop concepts for excavation footprints and associated *in situ* contaminated soil volumes. This supports cost estimates developed during the detailed analysis of alternatives.

1.1 Methodology

The USACE Buffalo District used a method developed by Argonne National Laboratory to estimate contaminated soil volumes at the Guterl Site. This method, known as the Bayesian Approaches to Adaptive Spatial Sampling (BAASS), utilizes both "soft" and "hard" data to generate a probability that a given area of a site will exceed a targeted cleanup objective or threshold (ANL, 2005). Soft data includes anomalies identified during a historical aerial photograph analysis, a non-intrusive geophysical survey, gamma walkover surveys, anecdotal information, and historical site/process knowledge. This information is used to create an initial conceptual site model (ICSM). Hard data can be defined as the results of laboratory analysis of collected soil samples, and is applied in BAASS to update the ICSM. The results of the BAASS model are then exported to ArcGIS (a Geographic Information System [GIS] software suite produced by Esri). The ArcGIS software was used to convert the BAASS output into spatial extents that represent areas that were greater than or equal to a certain probability of soil contamination. Each spatial extent represents a two-dimensional area with a probability that soil contained within the boundaries exceeded the preliminary remediation goals (PRGs). Table I-1 describes the relationship between the BAASS probability level and the potential for soil contamination.

Table I-1: BAASS Probability Description

Confidence Level	BAASS Probability	Description
90%	0.1	90% confidence the area includes all soil that exceeds PRGs (largest extent)
80%	0.2	80% confidence the area includes all soil that exceeds PRGs
50%	0.5	50% confidence the area includes all soil that exceeds PRGs
20%	0.8	20% confidence the area includes all soil that exceeds PRGs
10%	0.9	10% confidence the area includes all soil that exceeds PRGs (smallest extent)

The BAASS software simulation described above addressed only the lateral extent (i.e., the spatial area) of contaminated soil based on the ICSM and site characterization data. To calculate the *in situ* volume of contaminated soil, a three-dimensional model using the spatial extent modeled by the BAASS program and the maximum depth of contamination derived from the site characterization data was created. This process is described in more detail in the following sections.

1.1.1 Initial Conceptual Site Model

An analysis using BAASS requires developing an ICSM for the site. The ICSM captures the initial probabilities of contamination for an area. It presents an understanding, absent of sampling data, of where contamination is likely to be found. The contamination probability is captured by a set of grid points overlain on the area of interest. The probability of contamination in an ICSM can and often does vary from grid point to grid point. In the case of the Guterl Site, a 3-meter (m) (10-foot [ft]) grid spacing was used.

Information available for the Guterl Site for constructing the ICSM included a series of historical aerial photographs dating from 1938 through 2008 (USAGC, 2009), and surficial gamma walkover survey data. The historical aerial photographs were particularly valuable for identifying the extent of historically disturbed areas. Based on available soft information, individual grid nodes were assigned one of the following initial contamination probabilities: 0.001, 0.05, 0.40, 0.50, or 0.70. The ICSM for the Guterl Site is shown in Figure I-1.
In general, the following rules were followed in setting the initial contamination probabilities in the ICSM:

- **0.70:** Soil beneath buildings 6 and 8
- **0.50:** Area between older railroad tracks (1963 and earlier) and newer (circa 1966) railroad tracks, which was disturbed during the rail spur realignment
- **0.40:** Excised area and hotspots from gamma walkover survey (most gamma walkover hotspots were superseded because they were also between the railroad tracks)
- **0.05:** Remaining soil within the site boundary not previously assigned
- **0.001:** Grid points that were outside of the site boundary

1.1.2 Data Evaluation

The data used to generate the volume estimate were compiled from a 1999 radiological survey and the 2007 USACE remedial investigation (RI). The Oak Ridge Institute for Science and Education (ORISE) completed the 1999 survey on behalf of the United States Bankruptcy Court for the Western District of Pennsylvania (ORISE, 1999). The USACE published the data in the 2010 RI report (USACE, 2010). Only soil samples were considered for the BAASS calculations, utilizing the Thorium-232 (^{232}Th) and Uranium-238 (^{238}U) sample results. A subset of samples was analyzed by both off-site alpha spectrometry and on-site gamma spectrometry. For this relatively small subset of samples, only the off-site alpha spectrometry results were used during the analysis.

To ensure a more conservative approach in the volume estimate, where multiple samples were collected at various depths from a single location, the maximum result value from each location was used regardless of the depth at which it occurred. The resulting values were then compared to two different preliminary remediation goal (PRG) scenarios for the Guterl Site to determine the hit value needed by the BAASS model. The two PRG scenarios for the Guterl Site are the construction worker PRG (PRG-CW) and the groundwater protection PRG (PRG-GW).

For the construction worker scenario, the PRG-CW[1] is defined as 23 pCi/g for ^{238}U and 6.6 pCi/g for ^{232}Th. In this case, a sum-of-ratios (SOR) was calculated based on the PRG-CW. For sample locations with an SOR score above 1, a hit value of 1 was assigned, while for sample locations that had an SOR score between 0.99 and 0.5, a hit value of 0.5 was assigned, and for sample locations that had an SOR score below 0.5 a hit value of 0 was assigned.
The data, both above and below the SOR for the PRG-CW are shown in Figure I-2.

For the groundwater protection scenario, the PRG-GW[1] is defined as 3.7 pCi/g (the activity equivalent of the 11 mg/kg) for ^{238}U and 5.1 pCi/g for ^{232}Th. The ^{232}Th results above the PRG were collocated with ^{238}U exceedances, so only the ^{238}U data were used for this scenario. For sample locations with a ^{238}U concentration greater than (or equal to) 3.7 pCi/g, a hit value of 1 was assigned, while those sample locations that had a ^{238}U concentration less than 3.7 pCi/g were assigned a hit value of 0. The ^{238}U data, both above and below the PRG-GW are shown in Figure I-3.

1.1.3 Bayesian Approaches to Adaptive Spatial Sampling

In addition to the ICSM, BAASS requires three additional key parameters: a variogram function, the range for the variogram selected, and a search neighborhood. A variogram characterizes the degree of spatial dependence of a dataset. The variogram functional form combined with its range captures beliefs about the spatial autocorrelation present. The search neighborhood determines which sampling locations can contribute to the updating process at any particular grid node. The variogram functional form and range, in conjunction with the spatial pattern of sampled locations, determines how much weight each sampled location has in estimating the probability of contamination at a grid node. Bayesian updating (updating the probability estimate for a hypothesis as additional evidence is acquired) is used to merge the ICSM probabilities with those obtained from the indicator kriging (a method of approximating a function from a set of evaluations at a finite set of points). For the Guterl Site, 30 m (100 ft) was used for both the radius of the search neighborhood and for the range of the variogram. The functional form of the variogram was set to exponential. Finally, the sample locations and their associated results and hit values are entered into the BAASS software.

After updating, areas distant from sampled locations generally have contamination probabilities that reflect the ICSM, while areas where sampled locations are dense have probabilities that reflect the results of sampling.

1.1.4 Lateral Extents

The output from BAASS was an updated probability of contamination for each grid node, resulting from updating the ICSM with the hard data. The data were converted to a point file and projected onto the site base map. Using ArcGIS, the grid nodes could then be displayed such that the footprint for any given BAASS probability would be shown. For example, all points

[1] PRG values are incremental to background.

with a BAASS probability ≥ 0.5 may be displayed as colored dots, while all others are not displayed. This would show the footprint for the area of the site with a probability of contamination of 0.5 or greater. For the purposes of developing the contaminated soil footprints and volume estimates for this feasibility study, the BAASS probability level of 0.5 was used. To arrive at the final footprints, the grid nodes were combined into one or more polygons, and the edges were conservatively smoothed out. For the PRG-GW scenario, the footprint extended slightly below three of the buildings on the western half of the site. Since there is no known contamination underneath these buildings and historical knowledge does not support the existence of contamination under these buildings, the BAASS model output was modified to exclude any areas under these buildings. The 50 percent probability footprints, for both PRGs, are shown in Figures I-2 and I-3.

1.1.5 Three-Dimensional Volume Modeling

To generate contamination soil volumes for the two PRG scenarios, three-dimensional modeling was conducted using ArcGIS Spatial Analyst and 3D Analyst Extensions. The selected probability level contour identified by USACE (0.5 probability) was used as the basis for the initial *in situ* contaminated soil volume (i.e., prior to excavation). The volume of contaminated soils was calculated by determining the bottom surface of the contaminated soil and thus the thickness of contamination.

For the construction worker scenario, the bottom of contaminated soil for each soil sample location was determined by identifying the maximum depth at which a sample exceeded the SOR of 1 occurred. For the groundwater protection scenario the bottom of contaminated soil for each soil sample location was determined by identifying the maximum depth at which a ^{238}U concentration greater than 3.7 pCi/g occurred.

The depth to bedrock at the Guterl Site is relatively shallow (Figure I-3).If the determined maximum depth of contamination was within 0.3 m (1 ft) of the modeled bedrock surface depth, the bedrock surface depth was used as the maximum depth of contamination. In a few locations, the determined maximum contamination depth exceeded the modeled bedrock surface depth. At these locations the depth determined from the sample results was used and it was not truncated at the modeled bedrock surface.

After the maximum depths of contamination were determined for each sample location, these values were used to generate a three-dimensional surface utilizing ArcGIS 3D Analyst to represent the simulated bottom of the soil contamination. The volume of contaminated soil for each area of excavation was then generated by calculating, within ArcGIS, the thickness between the bottom of contamination and the soil surface.

Following the calculation of the *in situ* contaminated soil volume, engineering aspects of soil excavation, including safety sloping/benching (where required), were considered in order to develop an in situ total excavation volume. The primary guidance used in the development of the *in situ* total excavation volumes was the requirement from the USACE Safety and Health

Requirements Manual for a two-to-one horizontal to vertical side slope for excavations greater than 1.5 m (5 ft) in depth (USACE 2008). The majority of areas do not require side slopes or benching because the excavation depths are 1.5 m (5 ft) or less. For the areas with contamination below 1.5 m (5 ft) in depth, it was determined that due to their geographic location and the contouring algorithm, they would already meet the slope requirements, and thus no additional benching would be necessary.

2.0 Results

The contamination footprints derived from the 50percentconfidence (0.5 probability) contours show several distinct areas of contamination, as shown in Figures I-2 and I-3. Upon applying the three dimensional modeling, a surface depicting the contamination depth within the footprint is obtained. This surface is shown in Figure I-4 for the construction worker scenario and Figure I-5 for the groundwater protection scenario.

When the volume of each area is summed, the result yields an estimate of approximately 3,800 cubic meters (5,000 cubic yards) for the construction worker scenario, and 44,000 cubic meters (58,000 cubic yards) for the groundwater protection scenario, of in situ contaminated soil.

The final soil volumes resulting from this process represent the estimate of the *in situ* volume of contaminated soil generated for potential feasibility study remedial alternatives that involve soil excavation.

J.1 INTRODUCTION

This appendix provides information regarding the development of the feasibility study comparison estimates (FSCE) for the remedial alternatives included in the Former Guterl Specialty Steel Corporation Formerly Utilized Sites Remedial Action Program (FUSRAP) Site Feasibility Study (FS) Report, herein referred to as the FS Report. These cost estimates are intended to form a basis for comparing remedial alternatives and to support remedy selection. The costs used in this analysis are based on existing U.S. Army Corps of Engineers (USACE) contracts, vendor quotes, estimating reference manuals, and engineering estimates. Costs were estimated for comparison purposes only and are believed to be accurate within a range of -30 to +50 percent (%).

The format for the cost estimate is based on guidance from the *Guide to Developing and Documenting Cost Estimates During a Feasibility Study* (USACE/USEPA 2000). Section J.1 provides the general organization of the cost estimates, the project schedules, and estimating methodology. Section J.2 summarizes costs for each alternative in Fiscal Year (FY) 2020 dollars. Section J.3 provides the scope of work, detailed assumptions, and basis of estimate for each alternative. Attachments J-1, J-2 and J-3 provide the detailed backup information for the cost estimates for Alternatives 2, 3 and 4, respectively. The no action alternative (Alternative 1) has no costs associated with it.

J.2 GENERAL COST INFORMATION

J.2.1 Estimate Scope

The FS Report developed four alternatives for remediating soil, buildings and groundwater at the Former Guterl Specialty Steel Corporation FUSRAP site. The alternatives are:

Site-Wide Alternative 1: No Action. Under this alternative, no action would be taken for building materials or contents, soil, or groundwater/seeps impacted at the site. The No Action alternative contains no costs.

Site-Wide Alternative 2: Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, 24, and 35; Complete Soil Removal to the Soil Preliminary Remediation Goals (PRG)-Groundwater (GW) and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring.

Site-Wide Alternative 3: Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, 24, and 35; Complete Soil Removal to the Soil PRG-GW and Off-Site Disposal; Groundwater

Recovery Using Vertical Extraction Wells and a Rubblized Trench with Ex Situ Treatment, with Environmental Monitoring.

Site-Wide Alternative 4: Decontamination of Building 1; Dismantlement and Off-Site Disposal of Buildings 2, 3, 4/9, 5, 6, 8, and 24; Complete Soil Removal to the Soil PRG-Construction Worker (CW) and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring.

For each alternative (except Alternative 1) The FSCE includes (1) capital costs, including both direct and indirect costs; (2) annual operation and maintenance (O&M) costs; and (3) net present values of O&M costs. The detailed estimates presenting the non-discounted cost for each alternative are included as Attachments J-1, J-2, and J-3.

J.2.2 Schedule

The anticipated time required to implement a remedial alternative at the site varies with each alternative ranging from approximately 32 years inclusive of the design phase (Alternative 3) to 1,000+ years (No Action Alternative – limit of groundwater modeling). The timeframe for fieldwork for each alternative has been calculated using similar project experience and engineering judgment. The timeframe for fieldwork for Alternatives 2, 3, and 4 assumes that the dismantlement of Building 24 and the remediation of underlying soils will not be conducted at the time of the site-wide remedial action. For estimating purposes it is assumed that Building 24 will become available and authorized for dismantlement in year 30, and that Building 24 dismantlement and remediation of underlying soils will be conducted at that time.

For Alternative 2 the site-wide groundwater model was used to estimate the timeframe to achieve the maximum contaminant level (MCL) for uranium of 30 µg/L if soils above the soil PRG-GW are removed. The model predicted MCL exceedances in shallow groundwater until year 50 and until year 120 in the deep groundwater. For Alternative 3 the site-wide groundwater model was used to develop a conceptual design for a groundwater extraction system using a rubblized trench and vertical wells to capture the uranium plume. Removing soils above the soil PRG-GW would promote the reduction of uranium to less than the MCL of 30 µg/L in 30 years or less. For Alternative 4 a MNA program would be implemented at the site to address impacted groundwater once impacted soils are remediated to the PRG-CW. The MNA program is estimated to continue for 660 years based upon predicted MCL exceedances in the shallow groundwater until Year 430, and in the deep groundwater until approximately Year 660. The remediation and O&M time periods for each alternative are presented in Table J-1.

Table J-1. Remediation Timeframes for Remedial Alternatives

Alternative	Remedial Alternative Timeframe for Planning and Design (years)	Remedial Alternative Timeframe for Fieldwork (years)	O&M Timeframe (years)
1. No Action	0	0	0
2. Deferred Dismantlement of Building 24; Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, and 35; Complete Soil Removal to the Soil PRG-GW and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring	1.0	2.7	120
3. Deferred Dismantlement of Building 24; Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, and 35; Complete Soil Removal to the PRG-GW and Off-Site Disposal; Groundwater Recovery Using Vertical Wells and a Rubblized Trench with Ex Situ Treatment, with Environmental Monitoring	1.0	3.0	30
4. Decontamination of Building 1; Dismantlement and Off-Site Disposal of Buildings 2, 3, 4/9, 5, 6, 8, and 24; Complete Soil Removal to the Soil PRG-Construction Worker (CW) and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring	1.0	2.1	660

J.2.3 Estimating Methodology

The methodology used in the development of the FSCEs is a combination of the quantity take-off method and the bottom up method. In quantity take-off estimating costs are calculated based on unit cost multiplied by quantity or other input parameters. Unit cost data used in the relationship are primarily drawn from existing USACE contracts, vendor quotes, *RSMeans Construction Cost Data Manuals*, or engineering estimates. Quantity take-off estimating is useful for estimating the cost of common, well defined activities, (e.g., waste transportation and disposal) for which historical cost information exists. In bottom up estimating each task is broken down into smaller components. Individual estimates are developed to determine what specifically is needed to meet the requirements of each of these smaller components of the work.

The estimates for the smaller individual components are then aggregated to develop a larger estimate for the entire task as a whole. Bottom up estimating is useful for estimating the cost of unique or project-specific activities (e.g., radiological monitoring and sampling). Engineering and construction expertise was used to develop timing, manpower, and equipment requirements. The FSCEs were formatted using the *Hazardous, Toxic and Radioactive Waste Remedial Action and Operation and Maintenance Work Breakdown Structures* (USACE, et al, Feb 1996). Microcomputer Aided Cost Estimating System (MCACES) 2nd Generation (MII) Version 4.4 estimating software was used in the compilation of the cost estimates for the remedial alternatives.

J.2.4 Cost Elements

Federal construction programs have traditionally distinguished between capital and O&M costs. The remedial alternatives for this FS Report consist of those activities required to prevent or mitigate the migration of waste into the environment. An alternative may include activities considered to be O&M in situations where construction alone will not achieve the health and environmental protection criteria.

Each evaluated alternative has a remediation schedule with an estimated duration. The post-closure or O&M phase occurs after completion of the remediation and includes those activities necessary to confirm closure or to monitor and maintain controls on releases of hazardous waste into the environment. In addition, where unlimited use and unrestricted exposure are not achieved, five-year reviews (FYRs) will be conducted to ensure protectiveness of the selected remedy.

J.2.4.1 Capital Costs

Capital costs are those expenditures that are required to construct a remedial action. They are exclusive of costs required to operate or maintain the action throughout its lifetime. Capital costs consist primarily of expenditures initially incurred to build or install the remedial action (e.g., construction of a groundwater treatment system and related site work).

<u>Direct Capital Costs</u>

Direct capital costs include equipment, labor, and material necessary for implementing the remedial alternative. These include costs for:

- Mobilization;
- Monitoring, sampling, testing, and analysis;
- Site work;
- Surface water collection/controls;

- Soil collection/containment;
- Structure removal;
- Waste transportation/disposal;
- Site restoration;
- Engineering, supervision, management, and administration; and
- Demobilization and construction closeout.

Indirect Capital Costs

Indirect capital costs are those expenditures not incurred as part of the actual remediation but are ancillary to direct or construction costs. Indirect capital costs may include engineering, supervision, management, administration, financial, and other services necessary to implement a remedial action. In the FSCEs for this FS Report these costs are estimated as direct costs using bottom up estimating. Indirect costs may also include contractor and other markups, and these costs are handled as such in the remedial alternative cost estimates for this FS Report. These costs include:

- Home office overhead;
- Bond;
- Profit; and
- Contingency.

J.2.4.2 O&M Costs

O&M costs are those post-remediation costs necessary for monitoring and otherwise ensuring that hazardous waste will not migrate into the environment, including operation and maintenance of treatment systems installed as part of the remedial action construction. O&M costs can consist of direct and indirect costs. O&M costs may include:

- Mobilization;
- Monitoring, sampling, testing, and analysis;
- Maintaining LUCs;
- Operating, maintaining and removing treatment systems installed as part of the remedial action;
- Waste transportation/disposal;
- Site restoration;
- Engineering, supervision, management, and administration;
- Demobilization and project closeout;
- Home office overhead;
- Bond;

- Profit; and
- Contingency.

J.3 REMEDIAL ALTERNATIVE COST SUMMARY

Table J-2 provides a cost breakdown of capital costs and O&M costs for each alternative using a present value analysis (with discounting at 3.21%) and without discounting. The costs have been presented in Fiscal Year 2020 dollars. The present value analysis is a method to evaluate expenditures, either capital or O&M, that occur over different time periods. Present value calculations allow for cost comparisons of different remedial alternatives that are implemented over different timeframes by turning all future dollar expenditures into current dollar value. This single common value, referred to as present value, is the amount needed to be set aside at an initial point in time (base year) to assure that funds will be available in the future as needed. This process involves four basic steps: (1) define the period of analysis, (2) calculate the cash outflows (payments) for each year of the project, (3) select a discount rate to use in the present value calculation, and (4) calculate present value using standard economic formulae. The remedial alternatives' O&M costs were evaluated using year-0 to year-120 (Alternative 2), year-0 to year-30 (Alternative 3), and year-0 to year-660 (Alternative 4) periods of analysis. A 3.21% discount factor was used in present value calculations based on guidance received from USACE Huntsville Center – Programs & Planning Branch to use the "Historical *Consumer Price Index, All Urban Consumers (CPI-U), U.S. city average, for All Items*" average annual percentage change from 1913 to present (Source www.bls.gov). The capital costs have not been discounted due to their relatively short implementation duration. The detailed cost estimates for Alternative 2, Alternative 3, and Alternative 4 are included in Attachments J-1, J-2 and J-3, respectively.

125,920,912**Table J-2. Summary of Remedial Alternative Costs**

Remedial Alt.	Cost Category	Base Cost Estimate	Contingency Cost	Subtotal Cost	Alternative Total Cost
Non-discounted Operation & Maintenance Costs ($)					
2	Capital (Design/Const.)	125,920,912	54,967,358	180,888,271	197,599,149
	O&M	15,363,529	1,347,350	16,710,878	
3	Capital (Design/Const.)	131,967,162	57,322,415	189,289,577	214,385,659
	O&M	22,696,115	2,399,968	25,096,083	
4	Capital (Design/Const.)	74,230,669	30,182,935	104,413,605	186,061,317
	O&M	75,068,356	6,579,357	81,647,713	
Discounted Operation & Maintenance Costs[i] ($)					
2	Capital (Design/Const.)	125,920,912	54,967,358	180,888,271	186,055,615
	O&M	4,750,717	416,628	5,167,345	
3	Capital (Design/Const.)	131,967,162	57,322,415	189,289,577	205,551,983
	O&M	14,708,276	1,554,130	16,262,406	
4	Capital (Design/Const.)	74,230,669	30,182,935	104,413,605	109,662,912
	O&M	4,826,306	423,001	5,249,307	

$ - Fiscal Year 2020 U.S. dollars.
[i]O&M costs are discounted 3.21%.

J.4 BASIS OF COST ESTIMATE

The following sections summarize the cost components further detailed in the cost estimates in Attachments J-1, J-2, and J-3. Capital and O&M costs are presented separately.

J.4.1 Capital Cost Components

Capital cost components for the evaluated alternatives (excluding Alternative 1 – No Action) include, at a minimum:

- Mobilization and preparatory work (including project implementation plans);
- Monitoring, sampling, testing, and analysis;
- Site work;
- Surface water collection/controls;
- Soil collection/containment;
- Site water treatment;
- Structure removal;
- Waste transportation/disposal;
- Site restoration;

- Demobilization;
- Supervision and management;
- Engineering, surveying and quality control;
- Traffic control and security;
- Health & safety;
- Temporary construction facilities;
- Deferred Building 24 remedial action;
- Project administration and construction management;
- Home office overhead;
- Bond;
- Profit;
- Contingency; and
- Project closeout.

J.4.1.1 Mobilization and Preparatory Work

All alternatives (except Alternative 1 – No Action) include mobilization and preparatory work costs. Mobilization of equipment and facilities during remedial action is the transport, initial assembly and setup of construction equipment prior to project startup. Work associated with mobilization includes preparation of equipment for transport, equipment transportation and setup, drivers and equipment operators. Setup/construct temporary facilities during remedial action includes procurement, setup, and construction of office trailers, storage areas, fencing, access roads, site water treatment system, decontamination facilities, staging areas and other temporary facilities. Submittals/implementation plans includes the development of all necessary designs and work plans, including, but not limited to:

- Spill control plan;
- Erosion and sedimentation plan;
- Environmental protection plan;
- Site safety and health plan;
- Air monitoring plan;
- General site work plan;
- Construction quality control plan;
- Material handling/transportation/disposal plan;
- Sampling and analysis plan;
- Demolition plan;
- Radiation protection plan; and
- Site restoration plan

Each of these designs/plans will be prepared by competent project technical personnel and subject matter experts. A draft of each plan will undergo an internal independent technical review prior to submittal to the USACE. USACE and other stakeholder review comments will be addressed, responses formulated, and resolutions incorporated into the final design/plans.

J.4.1.2 Monitoring, Sampling, Testing, and Analysis

All alternatives (except Alternative 1 – No Action) include monitoring, sampling, testing and analysis costs. These activities will include:

- Meteorological monitoring - procurement, setup, testing, and operation of meteorological station(s) to measure and record wind, precipitation, and barometric pressure as well as other parameters.
- Radiation monitoring – measurement and recording of personal and area radiation levels during mobilization, structure and material decontamination, structure dismantlement, soils excavation, material handling, equipment/personnel decontamination, and demobilization.
- Air monitoring and sampling – installation and operation of six (6) site perimeter, and one (1) off-site background, air monitoring stations. Air filters from these stations will be counted weekly for gross alpha/gross beta and a monthly composite of the filters from each location will be sent to an off-site laboratory for radiological analysis. Installation and operation of three (3) work area air monitoring stations. Air filters from these stations will be counted daily for gross alpha/gross beta and a weekly composite of the filters from each location will be sent to an off-site laboratory for radiological analysis.
- Sampling surface water/liquid waste – collection of one (1) weekly site surface water sample, five (5) weekly site excavation/groundwater samples, and five (5) weekly site water treatment system effluent samples for radiological and chemical analysis at the on-site laboratory. Assume one (1) sample in ten will be sent to an off-site laboratory for quality assurance.
- Sampling soil – collection of Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) post–excavation confirmatory soil samples for radiological analysis at the on-site laboratory. Assume one sample in ten will be sent to an off-site laboratory for quality assurance. Collection of off-site unclassified fill and topsoil samples for radiological and chemical analysis at the on-site laboratory. Assume one (1) sample in ten will be sent to an off-site laboratory for quality assurance.
- Sampling radioactive contaminated media – collection of impacted soil samples for radiological and chemical waste acceptance analysis at the on-site laboratory. Assume one (1) sample in ten will be sent to an off-site laboratory for quality assurance.
- Laboratory chemical analysis – off-site chemical analysis of surface water, liquid waste, site water treatment system effluent, impacted soils, and off-site unclassified fill and topsoil samples at a frequency of one (1) sample in ten for quality assurance.

- Radioactive waste analysis – off-site radiological analysis (thorium, uranium) of site perimeter, background, and work area air monitoring filters. Off-site radiological analysis (radium, thorium, uranium) of surface water, liquid waste, site water treatment system effluent, impacted soils, post–excavation confirmatory soil samples. and off-site unclassified fill and topsoil samples at a frequency of one (1) sample in ten for quality assurance
- Geotechnical testing – off-site sieve analysis, Atterberg limits, and Proctor compaction for off-site unclassified fill to be used as backfill. On-site in place soil density testing of placed and compacted backfill by nuclear method.
- On-site laboratory facilities – mobilization, set-up, rental/ownership, certification/approval, equipment, labor, operation (during construction), and demobilization of a temporary, on-site radiological and chemical laboratory capable of attaining Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) certification. The radiochemistry methods include gamma spectroscopy, alpha spectroscopy, inductively-coupled plasma mass spectroscopy (ICP-MS), and gross alpha/beta analysis. The non-radiochemistry analysis includes ICP-MS for Resource Conservation and Recovery Act (RCRA) metals, pH, conductivity, total dissolved solids, total solids, and turbidity. The latter are the typical analyses that need to be performed to insure liquid effluent discharges are compliant with the local publicly owned treatment works (POTW) and/or site-specific discharge criteria/permits.

In addition, Alternative 3 includes the following alternative-specific monitoring, sampling, testing and analysis costs:

- Radiation monitoring – radiological monitoring of incoming gravel and concrete for construction of the concrete floor slab and tank foundation at the groundwater treatment building; radiological monitoring during the installation of monitoring wells and groundwater extraction wells.
- Monitoring wells – supply and installation of ten (10) shallow and four (4) deep monitoring wells. It is assumed that: shallow wells are 10-ft deep; deep wells are 60-ft deep; and all wells are 4-inch diameter.
- Concrete inspection and testing – construction inspection and materials testing during construction of the concrete floor slab and tank foundation at the groundwater treatment building.

J.4.1.3 Site Work

All alternatives (except Alternative 1 – No Action) include site work costs. These activities will include:

- Fence demolition - assume approximately 500 linear feet (LF) of chain-link fencing, and two (2) 14-foot wide fence gates will require demolition prior to impacted soils excavation.

- Clearing and grubbing - acreage for the PRG-GW is 26.6 acres (FS Report Figure 4-4), with a small percentage of this acreage extending under existing buildings, including Building 24. Therefore, for Alternatives 2 and 3 assume that approximately 23.2 acres of area will be cleared and grubbed. Affected acreage for the PRG-CW is approximately 4.22 acres, with approximately one acres extending under the buildings. Therefore, for Alternative 4 assume that approximately 3.22 acres will be cleared and grubbed. From inspection of aerial photography of the site, assume that 90% of the site will require clearing of dense brush, and 10% of the site will require cutting & chipping of light trees to 6" in diameter.
- Roads/Parking/Curbs/Walks – construction of temporary aggregate access and haul roads may be required during performance of the remedial action.

J.4.1.4 Surface Water Collection/Controls

All alternatives (except Alternative 1 – No Action) include surface water collection/controls costs. These activities consist of weekly inspections of, and required repairs to, temporary site erosion and sedimentation controls (silt fence/hay bales) during construction.

J.4.1.5 Soil Collection/Containment

All alternatives (except Alternative 1 – No Action) include impacted soil collection/containment. These activities will include excavating impacted soils, hauling impacted soils from excavation to lined interim stockpile pad, stockpiling impacted soils, and loading impacted soils for transportation and off-site disposal as follows:

- Excavation – per FS Report Table 4-4, estimated *in situ* volume of contaminated soil material above the soil PRG-GW is 58,000 bank cubic yards (BCY). Subtracting the estimated *in situ* volume of soil above the soil PRG-GW located under Building 24 (591 BCY) results in an estimated *in situ* volume for excavation of 57,409 BCY (Alternatives 2 and 3).
- Excavation – per FS Report Table 4-4, estimated *in situ* volume of contaminated soil material above the soil PRG-CW is 5,000 BCY. Subtracting the estimated *in situ* volume of soil above the PRG-CW located under Building 24 (10 BCY) results in an estimated *in situ* volume for excavation of 4,990 BCY (Alternative 4).
- Based on similar FUSRAP projects, an average excavation rate of 25 BCY/hour is assumed, utilizing an excavation crew consisting of a hydraulic excavator with equipment operator, dewatering pump with equipment operator, and one (1) laborer.
- Hauling - per FS Report Table 4-4, the estimated *ex situ* volume of contaminated soil material above the soil PRG-GW is determined by applying a 30 percent bulking factor to the estimated *in situ* volume.
- The estimated *ex situ* volume of contaminated soil material above the soil PRG-GW, net of the material under Building 24, is 74,632 loose cubic yards (LCY).

- The estimated ex situ volume of contaminated soil material above the PRG-CW, net of the material under Building 24, is 6,487 LCY.
- Based on matching the assumed excavation rate (25 BCY/hour), an average on-site material hauling rate of 32.5 LCY/hour is assumed, utilizing a hauling crew consisting of two (2) off-road articulated dump trucks with truck drivers.
- Stockpiling – based on matching the assumed on-site material hauling rate of 32.5 LCY/hour, an average stockpiling rate of 32.5 LCY/hour is assumed, utilizing a stockpiling crew consisting of a crawler dozer with equipment operator and one (1) laborer.
- Loading from stockpile – impacted soils will be loaded from the interim stockpile pad into lined intermodal containers for transportation and off-site disposal at an average rate of 32.5 LCY/hour utilizing a crew consisting of a 1.75 CY wheeled front-end loader with equipment operator and two (2) laborers.

J.4.1.6 Site Water Treatment

All alternatives (except Alternative 1 – No Action) include on-site treatment of site waters. These activities will include:

- Site water treatment plant start-up and performance testing – assume start-up and performance testing of the site water treatment plant can be accomplished in 20 working days utilizing a crew consisting of a site water treatment plant manager, a site water treatment plant technician, a plumber (1/2 time) and an electrician (1/2 time).
- Site water treatment plant operation – assume the site water treatment plant can be operated during construction by a crew consisting of a site water treatment plant manager and a site water treatment plant technician dedicated full time. Assume operating costs will include purchase and disposal of consumables such as filter bags, carbon, and ion exchange resins.

J.4.1.7 Structure Removal

All alternatives (except Alternative 1 – No Action) include structure removal costs. These activities will include:

- Decontamination – limited building contents and structure decontamination may include: grinding and/or scabbling to remove fixed contamination on concrete, stone, or brick surfaces; media blasting to remove fixed contamination on metal surfaces; and high-efficiency particulate arrestance (HEPA) vacuuming to collect removable contamination on building contents and in the interior of each building.
- Dismantlement – following removal of presumed asbestos-containing material (PACM), miscellaneous equipment and debris, each building will be dismantled using standard and specialty heavy equipment. Dust control will be accomplished by water spraying/misting during all phases of dismantlement and material handling. Building structural materials (i.e.,

steel, concrete) will be segregated, sized, and loaded into intermodal/roll-off containers or dump trailers for removal from the site.

J.4.1.8 Waste Transportation/Disposal

All alternatives (except Alternative 1 – No Action) include waste transportation/disposal costs. These activities will include:

- Container handling – a crew consisting of a roll-off truck with driver and two (2) laborers will prepare, move and stage waste containers on-site to facilitate the loading of impacted soils, PACM, miscellaneous equipment and debris, and building structural materials for removal from the site.
- Transportation to disposal facility – a properly licensed subcontracted transportation company will haul intermodal containers, dump trailers, or other manner of conveyance loaded with impacted soils, PACM, miscellaneous equipment and debris, and building structural materials from the project site to an appropriate off-site disposal or recycling facility.
- Disposal fees and taxes – charges associates with the disposal of impacted soils, PACM, impacted miscellaneous equipment and debris, and impacted building structural materials from the project site at an appropriate off-site disposal facility. Also included here is the estimated market value of miscellaneous equipment and building structural materials from the project site that meet the criteria for recycling.

J.4.1.9 Site Restoration

All alternatives (except Alternative 1 – No Action) include waste transportation/disposal costs. These activities will include:

- Earthwork – the excavation resulting from the removal of 57,409 BCY contaminated soil material above the soil PRG-GW (Alternatives 2 and 3) will be backfilled with imported, suitable fill. Imported fill will be delivered from off-site to the excavation, dumped, spread and compacted using standard heavy construction equipment. A 6-inch thick layer of imported topsoil will be spread over an approximately 23.2-acre area disturbed during the remedial action.
- Earthwork – the excavation resulting from the removal of 4,990 BCY contaminated soil material above the soil PRG-CW (Alternative 4) will be backfilled with imported, suitable fill. Imported fill will be delivered from off-site to the excavation, dumped, spread and compacted using standard heavy construction equipment. A 6-inch thick layer of imported topsoil will be spread over an approximately 3.2-acre area disturbed during the remedial action.

- Fencing – assume replacement of approximately 500 linear feet (LF) of chain-link fencing, and two (2) 14-foot wide fence gates that were removed to facilitate impacted soils excavation.
- Revegetation – assume vegetation will be established over an approximately 23.2-acre (Alternatives 2 and 3) area of newly placed topsoil by application of seed, fertilizer, and mulch.
- Revegetation – assume vegetation will be established over an approximately 3.2-acre (Alternative 4) area of newly placed topsoil by application of seed, fertilizer, and mulch.

J.4.1.10 Demobilization

All alternatives (except Alternative 1 – No Action) include demobilization and submittal preparation costs. Demobilization of equipment and facilities following remedial action is the dismantlement and transport of construction equipment at project completion. Work associated with demobilization includes equipment decontamination, preparation of equipment for transport, equipment transportation, drivers and equipment operators. Removal of temporary facilities following remedial action includes dismantlement and removal of office trailers, storage areas, fencing, access roads, site water treatment system, decontamination facilities, staging areas and other temporary facilities. Submittals include a construction documentation report.

J.4.1.11 General Requirements

J.4.1.11.1 Supervision and Management

All alternatives (except Alternative 1 – No Action) include supervision and management costs. These activities will include:

- Program Manager – assume a Program Manager located in the contractor's home office will be dedicated to the project 25% of the time (i.e., 10 hours/week) during the remedial action.
- Project Manager – assume a Project Manager located in the contractor's home office will be dedicated to the project 50% of the time (i.e., 20 hours/week) during the remedial action. The Project Manager will visit the project site for two (2) days, every other month, during the remedial action.
- Site Superintendent – a Site Superintendent located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action.
- Vehicles, travel and per diem – the Project Manager will incur travel expenses and require a vehicle (local travel at the site) and per diem during the bimonthly site visits. The Site Superintendent will require a site vehicle (pick-up truck) and per diem full-time during the remedial action. The Site Superintendent will incur travel expenses for one (1) weekend trip home each month during the remedial action.

J.4.1.11.2 Administration Job Office

All alternatives (except Alternative 1 – No Action) include administrative job office costs. These activities will include:

- Clerk/Typist/Receptionist – assume a Clerk/Typist/Receptionist located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action. The Clerk/Typist/Receptionist is a local hire and will not require a vehicle, travel or per diem.
- Computer Technician – assume a Computer Technician located at the project site will be dedicated to the project 50% of the time (i.e., 20 hours/week) during the remedial action. The Computer Technician is a local hire and will not require a vehicle, travel or per diem.
- Office Supplies – assume ten reams of copier/printer paper per month.

J.4.1.11.3 Engineering, Survey and Quality Control

All alternatives (except Alternative 1 – No Action) include engineering, surveying, and quality control costs. These activities will include:

- Civil Engineer – a Civil Engineer located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action. The Civil Engineer is a local hire and will not require a vehicle, travel or per diem.
- Surveyors – a survey crew consisting of one (1) Land Surveyor III, one (1) Land Surveyor I, a vehicle (truck), and survey instruments/equipment will be dedicated to the project 25% of the time (i.e., 10 hours/week) during the remedial action. The survey crew is a local hire and will not require travel or per diem.
- Waste Manager – a Waste Manager located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action. The Waste Manager is a local hire and will not require a vehicle, travel or per diem.
- Quality Control Manager - a Quality Control Manager located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action.
- Chemical Quality Control Manager (Data Acquisition Manager) – a Chemical Quality Control Manager (Data Acquisition Manager) located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action.
- Vehicles, travel and per diem - the Quality Control Manager and Chemical Quality Control Manager (Data Acquisition Manager) will each require a vehicle (automobile) and per diem full-time during the remedial action. Also, the Quality Control Manager and Chemical Quality Control Manager (Data Acquisition Manager) will each incur travel expenses for one (1) weekend trip home each month during the remedial action.

J.4.1.11.4 Traffic Control and Security

All alternatives (except Alternative 1 – No Action) include traffic control and security costs. These activities will include:

- Water truck – a 3,000-gallon water truck with truck driver will be operated on site 100% of the time during the remedial action for dust control.
- Watchmen/guards – a watchman/guard will be stationed at the project main access gate during normal working hours (i.e., 40 hours/week). Assume the watchman/guard is a local hire.

J.4.1.11.5 Health and Safety

All alternatives (except Alternative 1 – No Action) include health and safety costs. These activities will include:

- Safety & Health Manager – a Safety & Health Manager located at the contractor's home office will be dedicated to the project 50% of the time (i.e., 20 hours/week) during the remedial action. The Safety & Health Manager will visit the project site for two (2) days each month during the remedial action.
- Radiation Safety Officer - a Radiation Safety Officer located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action.
- Site Safety & Health Officer – a Site Safety & Health Officer located at the project site will be dedicated to the project 100% of the time (i.e., 40 hours/week) during the remedial action.
- Health and safety training – all site workers will complete site-specific health and safety training and radiation safety training.
- Health and safety medical exams – all site workers will participate in a medical surveillance program including an entry physical prior to starting work at the site, and an exit physical at the termination of working at the site.
- Personal protective equipment – all site workers will be provided appropriate personal protective equipment (PPE) commensurate with anticipated hazards. PPE may include hard hats, safety glasses, gloves, chemical resistant suits and respirators.
- Vehicles and per diem - the Safety & Health Manager will incur travel expenses and require a vehicle (local travel at the site) and per diem during the monthly site visits. The Radiation Safety Officer and Site Safety & Health Officer will each require a site vehicle (pick-up truck) and per diem full-time during the remedial action. The Radiation Safety Officer and Site Safety & Health Officer will each incur travel expenses for one (1) weekend trip home each month during the remedial action.

J.4.1.11.6 Temporary Construction Facilities

All alternatives (except Alternative 1 – No Action) include temporary construction facilities costs. These activities will include:

- Temporary construction facilities ownership – ownership or rental for field office trailers, facilities, and related items for temporary construction facilities for remedial action work.
- Temporary construction facilities operation – janitorial services for weekly cleaning and restocking temporary construction facilities. Also, purchase, deliver, spreading and compaction of gravel for haul road maintenance.
- Project utilities – usage of temporary project utilities (i.e., telephone, electrical, water, and internet) during remedial action work.

J.4.1.12 Alternative 3 Unique Features

In addition, Alternative 3 includes the following unique capital cost components:

- Development of groundwater extraction/treatment system design;
- Installation of monitoring and extraction wells;
- Construction of rubblized trench; and
- Construction of groundwater treatment system.

J.4.1.12.1 Development of Groundwater Extraction/Treatment System Design

Alternative 3 includes design of the groundwater extraction system, and preparation of plans and specifications for system construction. These designs/plans will be prepared by competent project technical personnel and subject matter experts. A draft of each design/plan will undergo an internal independent technical review prior to submittal to the USACE. USACE and other stakeholder review comments will be addressed, responses formulated, and resolutions incorporated into the final design/plans.

J.4.1.12.2 Installation of Monitoring and Extraction Wells

Alternative 3 includes supply and installation of ten (10) shallow and four (4) deep monitoring wells. It is assumed that the shallow monitoring wells are 10-ft deep and the deep monitoring wells are 60-ft deep. All monitoring wells are assumed to be 4-inch diameter. Alternative 3 also includes supply and installation of seven (7) shallow and three (3) deep extraction wells. It is assumed that the shallow extraction wells are 10-ft deep and the deep extraction wells are 60-ft deep. All extraction wells are assumed to be 4-inch diameter. As part of the design process, pumping tests would be performed in the shallow and deep aquifer near the proposed extraction well locations in the northwest portion of the Site and in the vicinity of the proposed extraction

wells near the southern property boundary to better characterize the aquifer and capture zones in the areas of the proposed extraction wells.

J.4.1.12.3 Construction of Rubblized Trench

Alternative 3 includes installation of a 600-ft long, 24-ft deep, 10-ft wide blast-fractured bedrock trench located near the southern property boundary. A test trench would be blasted as part of the pumping test program to provide data on the change in permeability in the blast zone during the pumping test. Assume the equivalent of a 50 ft x 24 ft x 10 ft test trench section will be blasted/rubblized. It is assumed that six (6), 12-inch diameter extraction sumps will be installed to a depth of 30 feet into the rubblized trench. It is assumed that approximately 1,500 lf of 3-inch/6-inch diameter high-density polyethylene (HDPE) double wall underground laterals and transfer piping will be installed from the rubblized trench and deep extraction wells to a groundwater treatment facility, to be centrally located on the project site.

J.4.1.12.4 Construction of Groundwater Treatment System

FS Report Section 4.3.3.3 Groundwater Treatment indicates that it is expected that ion exchange using a regeneration process will be selected as the groundwater treatment technology at the Guterl site. Assume that the groundwater treatment system will be housed in a 4,000 SF pre-engineered steel building. Assume the building will be constructed on a 6-inch thick, reinforced concrete slab underlain by a 12-inch compacted gravel fill layer. Groundwater treatment process equipment will include various tankage, ion exchange/demineralization equipment, pumps, controls, piping and valves.

J.4.1.13 Deferred Building 24 Remedial Action

All alternatives (except Alternative 1 – No Action) include deferred Building 24 remedial action costs. Soils beneath Building 24 are impacted above derived concentration guideline levels (DCGLs) but this contamination is not addressed under FUSRAP because Building 24 is an occupied building. Dismantlement of Building 24 is required to access contaminated soil above the PRG-GW/CW. FUSRAP-related contaminated soil underneath Building 24 is determined to be inaccessible, according to USACE Engineering Regulation, ER 200-1-4. Inaccessible contamination is defined as "FUSRAP eligible contaminants, as defined by paragraph 6.b.(2)(b) of this regulation, that have been determined by USACE in coordination with the support agency and land owner, to be inaccessible because the contamination is located under an active road, bridge, building, rail line, utility line, permanent structure or other physical obstruction that prevents taking a response action at the present time." The contamination is located underneath an active building used by the property owner. Dismantlement of Building 24 will be deferred until a later date when the building is no longer actively used. Abandonment of the building will allow for dismantlement and therefore, access to underlying contaminated soil.

For purposes of cost estimation, it is assumed that Building 24 will become unoccupied and therefor accessible for remediation in year 30. It is further assumed that in year 30 Building 24 will be at the end of its service life and will have no real estate market value. The present value of remediating Building 24 in year 30 was calculated using a discount rate of 3.21% based on guidance provided by Huntsville Center – Programs & Planning Branch to use the "Historical *Consumer Price Index, All Urban Consumers (CPI-U), U.S. city average, for All Items*" average annual percentage change from 1913 to present (Source www.bls.gov).

Deferred remediation of Building 24 in year 30 as a stand-alone remedial action will require mobilization, utilization and demobilization of all necessary support activities, similar to those needed during the site-wide remedial action (e.g., equipment mobilization / decontamination / demobilization, environmental monitoring, erosion & sedimentation controls, site water management, temporary facilities, project management, supervision, engineering, health & safety, etc.). Cost efficiencies may be realized by remediating Building 24 as part of the site-wide remedial action. The non-discounted estimated cost for deferred Building 24 remediation as a stand-alone effort is approximately $35.5 million dollars, including contingency. The non-discounted estimated cost for remediating Building 24 as part of the site-wide remedial action is approximately $21.7 million dollars, including contingency and real estate acquisition costs. The discounted (i.e., present value) estimated cost for deferred Building 24 remediation in year 30 is approximately $13.8 million dollars, including contingency. This discounted cost is included in the base and contingency costs for Alternatives 2, 3 and 4.

J.4.1.14 Home Office Overhead

All alternatives (except Alternative 1 – No Action) include home office overhead costs. Home office overhead is part of the contactor's overall cost of doing business, as shared by the project. Home office overhead has been included as a 15% markup (indirect cost) on capital and O&M costs for the prime contractor and for the health physics subcontractor. It should be noted that job office expenses have been itemized (bottom up estimate) as a direct cost for both the remedial construction (capital) and O&M project phases.

J.4.1.15 Bond

All alternatives (except Alternative 1 – No Action) include bond costs. A 1% markup (indirect cost) for prime contractor payment and performance bond has been applied.

J.4.1.16 Profit

All alternatives (except Alternative 1 – No Action) include contractor profit. An 8% markup (indirect cost) for prime contractor profit has been applied to the total cost. A 10% profit has

been applied to work performed by the health physics subcontractor. Profit for other subcontractors is included in the unit costs for each subcontracted item.

J.4.1.17 Contingency

All alternatives (except Alternative 1 – No Action) include contingency. Contingency is monies added to the estimated direct and indirect construction costs to cover unknowns, unforeseen uncertainties, and/or unanticipated conditions that are not possible to adequately evaluate or determine from the data on hand at the time the cost estimate is prepared. Contingencies relate to the uncertainties of the current know and defined project scope and are not a prediction of future project scope or schedule changes.

The appropriate contingency to apply to the estimated construction cost was determined by performing an Abbreviated Risk Analysis (ARA) on the project utilizing the Excel-based ARA template. The process for identifying contingency dollars in the ARA included the following steps:

1. Input the estimated project costs into the ARA template.
2. Identify and record project risks associated with each alternative using a multidisciplinary team of professionals.
3. Categorize the risks based on (1) the likelihood of occurrence, ranging from "unlikely" to "very likely"; and (2) the potential impact of the occurrence, ranging from "negligible" to "critical".
4. Apply the resulting contingency percentages to the corresponding estimated project costs.

The primary risks identified for Alternative 2 remedial action were related to the estimated waste transportation and disposal costs. These costs are based on volumes derived from site modeling (impacted soils) and assumed disposal determinations. Variations in waste quantities and/or disposal determinations will likely have a significant impact on project cost. Alternative 2 remedial action cost estimate assumes that a significant amount of the miscellaneous equipment, debris, and building structural materials to be removed from the site will be recycled. Disposal of these materials, if required rather than recycling, would also likely have a significant impact on project cost. The overall project contingency resulting from the ARA for Alternative 2 remedial action was approximately 43.7 %.

Variations in the estimated waste transportation and disposal costs were also identified as primary risks for the Alternative 3 remedial action. A concern was also raised that the potential exists for iron fouling of screens in the rubblized trench sumps and extraction wells that could impede water collection. Additional measures (e.g., acid metering pumps) may be required during installation of the rubblized trench and extraction wells to minimize this effect. The overall project contingency resulting from the ARA for Alternative 3 remedial action was approximately 43.4%.

Variations in the estimated waste transportation and disposal costs were also identified as primary risks for the Alternative 4 remedial action. The overall project contingency resulting from the ARA for Alternative 4 remedial action was approximately 40.7%.

Estimated contingencies have been applied to the cost estimate for each alternative and are included in Table J-2 and Attachments J-1, J-2, and J-3.

J.4.1.18 USACE Cost Components

J.4.1.18.1 Project Administration and Construction Management

All alternatives (except Alternative 1 – No Action) include project administration and construction management costs. USACE supervision and administration (S&A) and construction management costs are estimated at $125,000/month during remedial action, and for 12 months prior to remedial action (design/work plan preparation and review), and for six (6) months following remedial action (construction documentation report preparation and review). The estimated monthly cost is based on the actual level of effort required for these activities on past USACE Buffalo District FUSRAP projects.

J.4.1.18.2 Project Closeout

All alternatives (except Alternative 1 – No Action) include project closeout costs. USACE project closeout costs are estimated at $500,000/year, for two (2) years following completion of the remedial action based on the actual level of effort required for these activities on past USACE Buffalo District FUSRAP projects.

J.4.2 Operation and Maintenance Cost Components

Operation and maintenance cost components for the evaluated alternatives (excluding Alternative 1 – No Action) include, at a minimum:

- Mobilization and preparatory work (including project implementation plans);
- Engineering LUCs;
- Monitoring, sampling, testing, and analysis;
- General requirements;
- Project administration and construction management;
- Home office overhead;
- Bond;
- Profit; and
- Contingency.

J.4.2.1 Mobilization and Preparatory Work (including project implementation plans)

All alternatives (except Alternative 1 – No Action) include mobilization and preparatory work costs. These activities will include the development of all necessary designs and work plans, including a Site Safety and Health Plan and a Performance and Compliance Monitoring Plan. Each of these designs/plans will be prepared by competent project technical personnel and subject matter experts. A draft of each plan will undergo an internal independent technical review prior to submittal to the USACE. USACE and other stakeholder review comments will be addressed, responses formulated, and resolutions incorporated into the final design/plans.

J.4.2.2 Land Use Controls (LUCs)

All alternatives (except Alternative 1 – No Action) include LUCs costs. LUCs would be necessary to prevent human exposure to contaminated media (soil, buildings and groundwater) during remedial action. This activity includes the following engineering controls necessary to prevent human expose to contaminated media:

- Annual site inspections - performance of an annual inspection of the site to confirm that land-use controls implemented at the site remain in place. Site inspections will be performed until the impacted groundwater has been naturally attenuated to achieve the maximum contaminant level (MCL) for uranium (Alternative 2 – 120 years; Alternative 3 – 30 years; Alternative 4 – 660 years).
- Maintain site security fencing and signage – replacement of approximately 100 LF of site perimeter security fencing and approximately 10 warning signs, every five (5) years (Alternative 2 – 120 years; Alternative 3 – 30 years; Alternative 4 – 660 years).

J.4.2.3 Monitoring, Sampling, Testing, and Analysis

All alternatives (except Alternative 1 – No Action) include monitoring, sampling, testing and analysis costs. These activities will include:

- Radiation monitoring - monitoring of the work area during decommissioning of faulty site groundwater monitoring and extraction wells, and the installation of replacement groundwater monitoring and extraction wells and pumps.
- Monitoring wells – replace two (2) monitoring wells every five (5) years, decommission all monitoring wells at the end of the O&M period (Alternative 2 – 120 years; Alternative 3 – 30 years; Alternative 4 – 660 years).

- Groundwater sampling and analysis – under Alternative 2 collect groundwater samples from the indicated locations at the indicated frequencies, and analyze samples for volatile organic compounds (VOCs) and uranium:
    - Five (5) groundwater seep locations along the Erie Canal, annually for 120 years.
    - 16 shallow and 10 deep monitoring wells: semi-annually for years 1 – 3; annually for years 4 – 30; and every 5 years for years 35 – 120.
- Groundwater sampling and analysis – under Alternative 3 collect groundwater samples from the indicated locations at the indicated frequencies, and analyze samples for VOCs and uranium:
    - Five (5) groundwater seep locations along the Erie Canal, annually for 30 years.
    - 26 shallow and 14 deep monitoring wells, five (5) trench extraction sumps, and groundwater treatment system influent and effluent: semi-annually for years 1 – 3; annually for years 4 and 5; and every 5 years for years 10 – 30.
- Groundwater sampling and analysis – under Alternative 4 collect groundwater samples from the indicated locations at the indicated frequencies, and analyze for VOCs and uranium:
    - Five (5) groundwater seep locations along the Erie Canal, annually for 660 years.
    - 16 shallow and 10 deep monitoring sells: semi-annually for years 1 – 3; annually for years 4 – 30; and every 5 years for years 35 – 660.
- Five-year reviews (FYRs) - performance of a five-year review process that analyzes the implementation and effectiveness of the site remedy. Because the alternatives would result in uranium remaining in groundwater and potentially seeping to the Erie Canal, CERCLA requires that the Site be reviewed at least once every five years to ensure the protectiveness of the remedy. The components of the five-year review process are:
    - Preparation of Work Plan
    - Community Involvement and Notification
    - Documents Review
    - Data Review and Analysis
    - Site Inspection
    - Interviews
    - Protectiveness Determination
    - Preparation of Five-Year CERCLA Review Report
    - Status Meetings and Progress Reports

A five-year review will be performed every five (5) years during the O&M period (Alternative 2 – 120 years; Alternative 3 – 30 years, Alternative 4 – 660 years), beginning in year 5.

J.4.2.4 Disposal (Commercial)

All alternatives (except Alternative 1 – No Action) include waste disposal costs. These activities will include:

- Alternative 2: Transportation and off-site disposal of:
  - Drill cuttings and well materials from replacement of 2 monitoring wells every 5 years, during years 5 – 115.
  - Drill cuttings and well materials from decommissioning 16 shallow and 10 deep monitoring wells at the end of year 120.
- Alternative 3: Transportation and off-site disposal of:
  - Spent ion resin from operation of the groundwater treatment facility, annually for 30 years.
  - Drill cuttings and well materials from replacement of 2 monitoring wells every 5 years, during years 5 – 25.
  - Drill cuttings and well materials from replacement of 2 extraction wells every 5 years during years 5 – 25.
  - Drill cuttings and well materials from decommissioning 26 shallow and 14 deep monitoring wells at the end of year 30.
  - Drill cuttings and well materials from decommissioning of 7 shallow and 3 deep extraction wells, and 5 groundwater extraction trench sumps, at the end of year 30.
  - Groundwater Treatment Facility equipment and building contents at the end of year 30.
  - Groundwater Treatment Facility building structural and foundation materials at the end of year 30.
- Alternative 4: Transportation and off-site disposal of:
  - Drill cuttings and well materials from replacement of 2 monitoring wells every 5 years, during years 5 – 655.
  - Drill cuttings and well materials from decommissioning 16 shallow and 10 deep monitoring wells at the end of year 660.

J.4.2.5 Demobilization

Alternative 3 includes the decontamination, dismantlement and transport of groundwater treatment facility demolition equipment at O&M period completion. Work associated with demobilization includes preparation of equipment for transport, equipment transportation, drivers and equipment operators. Submittals include a construction documentation report.

J.4.2.6 General Requirements

All alternatives (except Alternative 1 – No Action) include general requirements costs. These activities will include:

J.4.2.6.1 Supervision and Management

- Project Manager (Alternative 2) - will work on the project: 160 hours during year 1; 80 hours per year during years 2 - 30; 40 hours per year during years 31 - 120; and an additional 40 hours every 5 years during years 5 - 120.
- Project Manager (Alternative 3) - will work on the project: 80 hours per year during years 1 - 30; an additional 80 hours every 5 years during years 5 – 25; and an additional 120 hours during year 30.
- Project Manager (Alternative 4) – will work on the project: 160 hours during year 1; 80 hours per year during years 2 – 30; 40 hours per year during years 31 – 660; and an additional 40 hours every 5 years, during years 5 – 660.

J.4.2.6.2 Engineering, Survey, and Quality Control

- Hydrogeologist (Alternative 2) - will work on the project: 80 hours for year 1; 40 hours per year during years 2 - 30; 24 hours per year during years 31 - 120, plus an additional 40 hours, every 5 years, during years 5 - 120.
- Hydrogeologist (Alternative 3) - will work on the project: 120 hours per year on the project during years 1 - 30; an additional 120 hours, every 5 years during years 5 – 25; and an additional 120 hours during Year 30.
- Hydrogeologist (Alternative 4) - will work on the project: 80 hours for year 1; 40 hours per year during years 2 - 30; 24 hours per year during years 31 - 660, plus an additional 40 hours, every 5 years, during years 5 - 660.

J.4.2.6.3 Health and Safety

- Site Safety & Health Officer (Alternative 2) - will work on the project 40 hours during year 1; 40 hours per year during years 2 - 30; 16 hours per year during years 31 - 120, plus an additional 40 hours, every 5 years, during years 5 - 120.
- Site Safety & Health Officer (Alternative 3) - will work on the project: 120 hours per year during years 1 - 30; an additional 80 hours, every 5 years during years 5 – 25; and 120 hours during year 30.
- Site Safety & Health Officer (Alternative 4) - will work on the project 40 hours during year 1; 40 hours per year during years 2 - 30; 16 hours per year during years 31 - 660, plus an additional 40 hours, every 5 years, during years 5 - 660.

J.4.2.7 Alternative 3 Unique Features

In addition, Alternative 3 includes the following O&M cost components:

- Replace groundwater extraction pumps and wells, decommission all at end of O&M period;

- Operate and maintain groundwater treatment facility;
- Transport and dispose groundwater treatment facility effluent and spent consumables;
- Transport and dispose monitoring and extraction well materials; and
- Demolish, transport and dispose groundwater treatment facility equipment and structure.

J.4.2.7.1 Replace Groundwater Extraction Pumps/Wells, Decommission at end O&M Period

Seven (7) shallow and three (3) deep groundwater extraction wells are to have been installed during the remedial action. It is assumed that the shallow wells are 10-ft deep, the deep wells are 60-ft deep, and all wells are 4-inch diameter. Per the FS Report, assume that two (2) extraction wells will be replaced every five 5 years during years 5 - 25. Replacement wells will be installed within approximately 50 feet of the removed well. Assume seven (7) shallow extraction wells and three (3) deep extraction wells will be decommissioned at the end of year 30. Assume that five (5) groundwater extraction pumps will be replaced every five (5) years. Assume replacement of four (4) shallow extraction well pumps and one (1) deep extraction well pump every five (5) years during years 5 - 25.

J.4.2.7.2 Operate and Maintain Groundwater Treatment Facility

Assume the groundwater treatment facility can be operated during the O&M period (30 years) by a crew consisting of a site water treatment plant manager and a site water treatment plant technician dedicated full time. Assume operating costs will include purchase of consumables such as ion exchange resins.

J.4.2.7.3 Transport/Dispose Groundwater Treatment Facility Effluent & Spent Consumables

Following treatment, groundwater treatment facility effluent would be discharged to the industrial sewer line, which connects to the City of Lockport POTW, in accordance with approved acceptance criteria. Groundwater treatment facility spent ion exchange resin and other consumables would be transported off-site to an appropriate disposal facility.

J.4.2.7.4 Transport and Dispose Extraction Well Materials

This activity includes transportation and off-site disposal of drill cuttings (soil), well construction materials, pumps, piping and controls generated during the periodic replacement during the O&M period, and final decommissioning of seven (7) shallow and three (3) deep groundwater extraction wells.

J.4.2.7.5 Demolish/Transport/Dispose Groundwater Treatment Facility Equipment/Structure

This activity includes removal of groundwater treatment equipment, and the demolition of the groundwater treatment facility at the end of the O&M period (year 30). This activity also

includes transportation and off-site disposal of removed groundwater treatment equipment and groundwater treatment facility demolition debris.

J.4.2.8 Home Office Overhead

Home office overhead is part of the contractor's overall cost of doing business, as shared by the project. Home office overhead has been included as a 15% markup (indirect cost) on capital and O&M costs for the prime contractor and for the health physics subcontractor. It should be noted that job office expenses have been itemized (bottom up estimate) as a direct cost for both the remedial construction (capital) and O&M project phases.

J.4.2.9 Bond

A 1% markup (indirect cost) for prime contractor payment and performance bond has been applied to the total cost.

J.4.2.10 Profit

An 8% markup (indirect cost) for prime contractor profit has been applied to the total cost. A 10% profit has been applied to work performed by the health physics subcontractor. Profit for other subcontractors is included in the unit costs for each subcontracted item.

J.4.2.11 Contingency

Contingency is monies added to the estimated direct and indirect construction costs to cover unknowns, unforeseen uncertainties, and/or unanticipated conditions that are not possible to adequately evaluate or determine from the data on hand at the time the cost estimate is prepared. Contingencies relate to the uncertainties of the current know and defined project scope and are not a prediction of future project scope or schedule changes.

The appropriate contingency to apply to the estimated construction cost was determined by performing an Abbreviated Risk Analysis (ARA) on the project utilizing the Excel-based ARA template. The process for identifying contingency dollars in the ARA included the following steps:

1. Input the estimated project costs into the ARA template.
2. Identify and record project risks associated with each alternative using a multidisciplinary team of professionals.
3. Categorize the risks based on (1) the likelihood of occurrence, ranging from "unlikely" to "very likely"; and (2) the potential impact of the occurrence, ranging from "negligible" to "critical".
4. Apply the resulting contingency percentages to the corresponding estimated project costs.

The primary risks identified for Alternative 2 operations and maintenance were: extended duration of the operations and maintenance period required to achieve the groundwater MCL for uranium, additional sampling and analysis required, and uncertainty regarding application of land use controls. The overall project contingency resulting from the ARA for Alternative 2 operations and maintenance was approximately 8.8%.

Extended duration of the operations and maintenance period required to achieve the groundwater MCL for uranium, and additional sampling and analysis required were also identified as primary risks for the Alternative 3 operations and maintenance. Additionally, a concern was raised that the potential exists for iron fouling of screens in the rubblized trench sumps and extraction wells that could impede water collection. Additional measures (e.g., acid metering pumps) may be required during operations and maintenance to minimize this effect. The overall project contingency resulting from the ARA for Alternative 3 operations and maintenance was approximately 10.6%.

Extended duration of the operations and maintenance period required to achieve the groundwater MCL for uranium, and additional sampling and analysis required were also identified as primary risks for the Alternative 4 operations and maintenance. The overall project contingency resulting from the ARA for Alternative 4 operations and maintenance was approximately 8.8%.

Estimated contingencies have been applied to the operations and maintenance cost estimate for each alternative and are included in Table J-2 and Attachments J-1, J-2, and J-3.

J.4.2.12 USACE Cost Components

All alternatives (except Alternative 1 – No Action) include project administration and construction management costs during the O&M period. USACE supervision and administration (S&A) and construction management costs are estimated at $50,000/year during the O&M period, based on the anticipated level of effort required for these activities.

Setup / Construct Temporary Facilities					
Office Trailers	5.0	ea	$8,074.53	$40,373	*Trailers: (1) dbl-wide contractor, (1) dbl-wide operations, (1) health physics trailer*
Storage Facilities	2.0	ea	$1,636.57	$3,273	*(2) 40' x 8' storage containers*
Decontamination Facilities for Personnel	2.0	ea	$11,405.68	$22,811	*(2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable, grey)*
Decontamination Facilities for Construction Equipment / Vehicles	1,000.0	sf	$28.56	$28,558	*20 's 50' lined asphalt construction equipment decontamination pad (includes site prep and decontamination equip)*
Lunch / Break Trailer (Craft Labor)	1.0	ea	$15,725.10	$15,725	*(1) dbl-wide crew break trailer (includes hook-ups, tables and chairs)*
Toilets	5.0	ea	$134.12	$671	*(5) portable toilets*
Government Trailers (USACE Office)	1.0	ea	$6,889.82	$6,890	*(1) single-wide trailer for USACE personnel (incl. hook-ups, furniture)*
Guard Houses	1.0	ea	$5,452.42	$5,452	*20' x 8' trailer at site entrance for security guard (incl. hook-ups, furniture)*
Truck Scales	1.0	ea	$49,890.02	$49,890	*60' x 10' 50 ton portable truck scale (incl. electric hookup)*
Wastewater Holding Tanks	1.0	ls	$172,305.77	$172,306	*Sand filtration and carbon absorption system for site water treatment*
Security Fencing	1,000.0	lf	$62.09	$62,088	*Install 1000lf of 8' chain link fencing around project site*
Signs	1.0	ls	$5,091.16	$5,091	*Project sign, safety sign, bulletin board, and (20) warning signs*
Erosion Control	5,000.0	lf	$5.55	$27,765	*Install 5,000lf of silt fencing and 1,000lf of hay bales for erosion control*
Interim Stockpile Pad	2,500.0	sf	$13.98	$34,953	*50' x 50' lined asphalt stockpile pad (includes site prep)*
Monitoring, Sampling, Testing, and Analysis					
Meteorological Monitoring	2.0	ea	$4,540.59	$9,081	*(2) meteorological stations with power*
Radiation Monitoring	1.0	ls	$2,798,683.88	$2,798,684	*Includes baseline radiological survey, radiological monitoring of building decontamination / dismantlement, impacted soils excavation, and incoming/outgoing materials*
Air Monitoring and Sampling	31.0	mo	$29,612.39	$917,984	*Perimeter (six locations and one off-site background) and work area (two locations) air monitoring at project site*
Sampling Surface Water / Groundwater / Liquid Waste	31.0	mo	$1,889.84	$58,585	*Sampling site surface water, excavation water, and site water treatment effluent*
Sampling Soil and Sediment	1.0	ls	$90,744.53	$90,745	*Post-excavation confirmatory soil sampling, off-site unclassified fill and topsoil sampling*
Sampling Radioactive Contaminated Media	1.0	ls	$570,897.99	$570,898	*Sampling impacted soils, building contents and building debris for waste acceptance criteria analysis*
Laboratory Chemical Analysis	1.0	ls	$372,294.31	$372,294	*Off-site quality assurance chemical analysis of one sample in ten for: site surface water, excavation water, site water treament effluent, impacted soils waste acceptance, and off-site unclassified fill and topsoil*
Radioactive Waste Analysis	1.0	ls	$1,248,141.51	$1,248,142	*Off-site radiological analysis of perimeter and work area air monitoring samples. Off-site quality assurance radiological analysis of one sample in ten for: site surface water, excavation water, site water treatment effluent, post-excavation confirmatory soil samples, impacted soils for waste acceptance, offsite unclassified fill and topsoil samples.*
Geotechnical Testing	1.0	ls	$108,503.57	$108,504	*Off-site classification testing of off-site unclassified fill, nuclear density testing of placed and compacted off-site unclassified fill (excavation backfill)*
On-Site Laboratory Facilities	31.0	mo	$232,659.86	$7,212,456	*Mobilization, rental, operation, and demobilization of temporary on-site ELAP certified radiological and chemical analysis laboratory*
Site Work					
Demolition	500.0	lf	$6.51	$3,254	*Demolition of 500 lf of chain-link fencing and two 14-ft wide gates*
Clearing and Grubbing	23.2	acre	$1,885.04	$43,733	*Clearing and grubbing 23.2 acres of brush, stumps and light trees*
Roads/Parking/Curbs/Walks	50,000.0	sf	$1.57	$78,625	*Construction of 2,500 LF of 20-ft wide x 1-ft thick aggregate haul road(s)*
Surface Water Collection and Control					
Sediment Barriers	31.0	mo	$7,065.72	$219,037	*Weekly inspection and repair of silt fencing and hay bales*
Solids Collection and Containment					
Contaminated Soil Collection	57,409.0	BCY	$152.51	$8,755,366	*Excavation, on-site hauling, stockpiling and loading for disposal*
Liquids / Sediments / Sludge Collection and Containment					
Waste water treatment plant (WWTP) startup and performance testing	1.0	ls	$33,319.15	$33,319	*Includes startup process and testing for site water treatment plant*
Treatment Plant Operation	31.0	mo	$30,763.20	$953,659	*Operation of site water treatment plant*

Deferred Building 24 Remedial Action (Present Value) - Performed as a stand-alone project in Year 30 (discount 3.21%)					
Mobilization and Preparatory Work					
Mobilize Construction Equipment	38.0	ea	$571.74	$21,726	*38 loads / pieces on flatbed transport*
Submittals / Implementation Plans	1.0	ls	$150,508.78	$150,509	*Draft, ITR, agency review, response and final submittals of the following plans: Spill Control, Erosion and Sedimentation Control, Environmental Protection, Site safety and Health, Air Monitoring, General Site Work, Construction Quality Control, Material Handling/Transportation/Disposal, Sampling and Analysis, Demolition, Radiation Protection, Site Restoration*
Setup / Construct Temporary Facilities	1.0	ls	$184,250.20	$184,250	*Mobilization and setup of the following temporary facilities: office trailers, storage facilities, personnel decontamination facility, construction equipment/vehicle decontamination facility, break trailer, portable toilets, USACE office trailer, guard trailer, site water treatment system, security fencing, project signs, erosion control*
Monitoring, Sampling, Testing, and Analysis					
Meteorological Monitoring	1.0	ls	$3,516.28	$3,516	*(2) meteorological stations with power*
Radiation Monitoring	1.0	ls	$170,047.54	$170,048	*Includes baseline radiological survey, radiological monitoring of building decontamination / dismantlement, impacted soils excavation, and incoming/outgoing materials*
Air Monitoring and Sampling	13.0	mo	$12,152.54	$157,983	*Perimeter (six locations and one off-site background) and work area (three locations) air monitoring at project site*
Sampling Surface Water / Groundwater / Liquid Waste	13.0	mo	$730.57	$9,497	*Sampling site surface water, excavation water, and site water treatment effluent*
Sampling Soil and Sediment	1.0	ls	$2,107.77	$2,108	*Post-excavation confirmatory soil sampling, off-site unclassified fill and topsoil sampling*
Sampling Radioactive Contaminated Media	1.0	ls	$35,306.42	$35,306	*Sampling impacted soils, building contents and building debris for waste acceptance criteria analysis*
Laboratory Chemical Analysis	1.0	ls	$34,925.13	$34,925	*Off-site chemical analysis of samples for: site surface water, excavation water, site water treament effluent, impacted soils waste acceptance, and off-site unclassified fill and topsoil*
Radioactive Waste Analysis	1.0	ls	$105,637.71	$105,638	*Off-site radiological analysis of perimeter and work area air monitoring samples. Off-site radiological analysis of samples for: site surface water, excavation water, site water treatment effluent, post-excavation confirmatory soil samples, impacted soils for waste acceptance, offsite unclassified fill and topsoil samples.*
Geotechnical Testing	1.0	ls	$379.35	$379	*Off-site classification testing of off-site unclassified fill, nuclear density testing of placed and compacted off-site unclassified fill (excavation backfill)*
On-Site Laboratory Facilities	13.0	mo	$92,102.98	$1,197,339	*Mobilization, rental, operation, and demobilization of temporary on-site ELAP certified radiological and chemical analysis laboratory*
Site Work					
Demolition	500.0	lf	$2.52	$1,260	*Demolition of 500 lf of chain-link fencing and two 14-ft wide gates*
Roads/Parking/Curbs/Walks	50,000.0	sf	$0.61	$30,444	*Construction of 2,500 LF of 20-ft wide x 1-ft thick aggregate haul road(s)*
Surface Water Collection and Control					
Sediment Barriers	13.0	mo	$2,735.31	$35,559	*Weekly inspection and repair of silt fencing and hay bales*
Solids Collection and Containment					
Contaminated Soil Collection	591.0	bcy	$59.70	$35,284	*Includes excavation and loading for disposal*
Liquids / Sediments / Sludge Collection and Containment					
Waste water treatment plant (WWTP) startup and performance testing	1.0	ls	$12,901.37	$12,901	*Includes startup process and testing for site water treatment plant*
Treatment Plant Operation	13.0	mo	$11,911.71	$154,852	*Operation of site water treatment equipment*
Drums / Tanks / Structures / Miscellaneous Demolition and Removal					
Decontamination - Building 24	66,290.0	sf	$0.79	$52,608	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Dismantlement - Building 24	78,400.0	sf	$12.18	$954,994	*Mechanical structure dismantlement*
Disposal (Commercial)					
Container Handling	1.0	ls	$69,423.28	$69,423	*On-site handling of containers for building debris, impacted soils*
Transportation to Storage/Disposal Facility	44,687.0	ton	$43.57	$1,947,117	*Transportation of waste to approved disposal facilities. Transportation of building structural materials to approved recycling facilities.*
Disposal Fees and Taxes	44,687.0	ton	$14.13	$631,510	*Fees/taxes for disposal of waste at approved disposal facilities. Market value of recycled building structural materials.*
Site Restoration					
Earthwork	591.0	cy	$44.34	$26,206	*Includes purchase, delivery, spreading, and compaction of off-site unclassified fill. Includes purchase, delivery and spreading of off-site topsoil.*
Permanent Features	500.0	lf	$32.09	$16,047	*Replacing 500lf of chain-link fencing; includes (2) 14ft wide gates*
Revegetation and Planting	1.3	acre	$5,735.56	$7,628	*Seeding, fertilizing and mulching of 1.33 acres post construction*
Demobilization					
Removal of Temporary Facilities	1.0	ls	$43,916.69	$43,917	*Demobilization of the following temporary facilities: office trailers, storage facilities, personnel decontamination facility, construction equipment/vehicle decontamination facility, break trailer, portable toilets, USACE office trailer, guard trailer, site water treatment system, security fencing, project signs, erosion control*
Final Decontamination	1.0	ls	$127,848.29	$127,848	*Remove media and decontaminate WWTP equipment; Decontamination of construction equipment prior to removal from the site*
Demobilize Construction Equipment	38.0	ea	$571.74	$21,726	*38 loads / pieces on flatbed transport*
Submittals	1.0	ls	$31,175.02	$31,175	*Draft, ITR, agency review, response and final submittal of Construction Documentation Report*

Setup / Construct Temporary Facilities					
Office Trailers	5.0	ea	$8,074.53	$40,373	*Trailers: (1) dbl-wide contractor, (1) dbl-wide operations, (1) health physics trailer*
Storage Facilities	2.0	ea	$1,636.57	$3,273	*(2) 40' x 8' storage containers*
Decontamination Facilities for Personnel	2.0	ea	$11,405.68	$22,811	*(2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable, grey)*
Decontamination Facilities for Construction Equipment / Vehicles	1,000.0	sf	$28.56	$28,558	*20 'x 50' lined asphalt construction equipment decontamination pad (includes site prep and decontamination equip)*
Lunch / Break Trailer (Craft Labor)	1.0	ea	$15,725.10	$15,725	*(1) dbl-wide crew break trailer (includes hook-ups, tables and chairs)*
Toilets	5.0	ea	$134.12	$671	*(5) portable toilets*
Government Trailers (USACE Office)	1.0	ea	$6,889.82	$6,890	*(1) single-wide trailer for USACE personnel (incl. hook-ups, furniture)*
Guard Houses	1.0	ea	$5,452.42	$5,452	*20' x 8' trailer at site entrance for security guard (incl. hook-ups, furniture)*
Truck Scales	1.0	ea	$49,890.02	$49,890	*60' x 10' 50 ton portable truck scale (incl. electric hookup)*
Wastewater Holding Tanks	1.0	ls	$172,305.77	$172,306	*Sand filtration and carbon absorption system for site water treatment*
Security Fencing	1,000.0	lf	$62.09	$62,088	*Install 1000lf of 8' chain link fencing around project site*
Signs	1.0	ls	$5,091.16	$5,091	*Project sign, safety sign, bulletin board, and (20) warning signs*
Erosion Control	5,000.0	lf	$5.55	$27,765	*Install 5,000lf of silt fencing and 1,000lf of hay bales for erosion control*
Interim Stockpile Pad	2,500.0	sf	$13.98	$34,953	*50' x 50' lined asphalt stockpile pad (includes site prep)*
Monitoring, Sampling, Testing, and Analysis					
Meteorological Monitoring	2.0	ea	$4,540.59	$9,081	*(2) meteorological stations with power*
Radiation Monitoring	1.0	ls	$3,002,010.25	$3,002,010	*Includes baseline radiological survey, radiological monitoring of building decontamination / dismantlement, impacted soils excavation, incoming/outgoing materials, monitoring well / extraction well / sump installation*
Air Monitoring and Sampling	35.0	mo	$29,465.47	$1,031,292	*Perimeter (six locations and one off-site background) and work area (two locations) air monitoring at project site*
Monitoring Wells	14.0	ea	$5,746.35	$80,449	*Installation of 10 shallow and 4 deep monitoring wells to monitor performance of groundwater extraction system*
Sampling Surface Water / Groundwater / Liquid Waste	35.0	mo	$1,891.82	$66,214	*Sampling site surface water, excavation water, and site water treatment effluent*
Sampling Soil and Sediment	1.0	ls	$90,744.53	$90,745	*Post-excavation confirmatory soil sampling, off-site unclassified fill and topsoil sampling*
Sampling Radioactive Contaminated Media	1.0	ls	$570,897.99	$570,898	*Sampling impacted soils, building contents and building debris for waste acceptance criteria analysis*
Laboratory Chemical Analysis	1.0	ls	$391,190.26	$391,190	*Off-site quality assurance chemical analysis of one sample in ten for: site surface water, excavation water, site water treament effluent, impacted soils waste acceptance, and off-site unclassified fill and topsoil*
Radioactive Waste Analysis	1.0	ls	$1,287,363.33	$1,287,363	*Off-site radiological analysis of perimeter and work area air monitoring samples. Off-site quality assurance radiological analysis of one sample in ten for: site surface water, excavation water, site water treatment effluent, post-excavation confirmatory soil samples, impacted soils for waste acceptance, offsite unclassified fill and topsoil samples.*
Geotechnical Testing	1.0	ls	$108,503.57	$108,504	*Off-site classification testing of off-site unclassified fill, nuclear density testing of placed and compacted off-site unclassified fill (excavation backfill)*
On-Site Laboratory Facilities	35.0	mo	$232,230.18	$8,128,056	*Mobilization, rental, operation, and demobilization of temporary on-site ELAP certified radiological and chemical analysis laboratory*
Concrete Inspection and Testing	1.0	ea	$1,309.61	$1,310	*Inspection during concrete placement for Temporary Groundwater Treatment Facility Building; concrete cylinder compressive strength testing*
Site Work					
Demolition	500.0	lf	$6.51	$3,254	*Demolition of 500 lf of chain-link fencing and two 14-ft wide gates*
Clearing and Grubbing	23.2	acre	$1,885.04	$43,733	*Clearing and grubbing 23.2 acres of brush, stumps and light trees*
Roads/Parking/Curbs/Walks	50,000.0	sf	$1.57	$78,625	*Construction of 2,500 LF of 20-ft wide x 1-ft thick aggregate haul road(s)*

Feasibility Study Comparison Estimate

Cost Estimate Item / Activity	Quantity	Unit of Measure	Unit cost	Total	Notes
Surface Water Collection and Control					
Sediment Barriers	35.0	mo	$7,067.20	$247,352	*Weekly inspection and repair of silt fencing and hay bales*
Groundwater Collection and Control					
Extraction Wells	10.0	ea	$41,826.38	$418,264	*Installation of 7 shallow and 3 deep extraction wells near the southern property border*
Subsurface Drainage / Collection	1.0	ea	$1,206,679.52	$1,206,680	*Installation of 600-ft long, 24-ft deep, 10-ft wide blast-fractured rubblized trench located near the southern property boundary*
Solids Collection and Containment					
Contaminated Soil Collection	57,409.0	BCY	$152.51	$8,755,366	*Excavation, on-site hauling, stockpiling and loading for disposal*
Liquids / Sediments / Sludge Collection and Containment					
Waste water treatment plant (WWTP) startup and performance testing	1.0	ls	$33,319.15	$33,319	*Includes startup process and testing for site water treatment plant*
Treatment Plant Operation	35.0	mo	$30,763.13	$1,076,710	*Operation of site water treatment plant*
Drums / Tanks / Structures / Miscellaneous Demolition and Removal					
Decontamination					
Decontamination - Building 1	12,480.0	sf	$2.05	$25,586	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 2	79,710.0	sf	$2.05	$163,356	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 3	61,140.0	sf	$2.05	$125,271	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 4/9	48,240.0	sf	$2.05	$98,862	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 5	4,500.0	sf	$2.04	$9,195	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 6	14,180.0	sf	$2.05	$29,043	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 8	28,300.0	sf	$2.05	$57,968	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 35	5,660.0	sf	$2.05	$11,594	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Dismantlement					
Dismantlement - Building 1	8,800.0	sf	$37.25	$327,840	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 2	68,900.0	sf	$33.56	$2,312,021	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 3	67,400.0	sf	$32.25	$2,173,521	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 4/9	47,400.0	sf	$34.91	$1,654,709	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 5	3,800.0	sf	$36.32	$138,030	*Removal of misc. equipment and mechanical structure dismantlement*
Dismantlement - Building 6	15,100.0	sf	$45.86	$692,413	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 8	27,900.0	sf	$46.72	$1,303,476	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 35	3,280.0	sf	$44.98	$147,522	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Chemical Treatment					
Construct Groundwater Treatment Facility	1.0	ea	$911,978.32	$911,978	*Construction of groundwater treatment system housed in a 4,000 SF pre-engineered steel building, slab on grade*
Disposal (Commercial)					
Container Handling	1.0	ls	$1,092,020.57	$1,092,021	*On-site handling of Containers for building debris, impacted soils, decon pad and interim stockpile pad material*
Transportation to Storage/Disposal Facility	279,805.0	ton	$139.93	$39,152,824	*Transportation of waste to approved disposal facilities. Transportation of building structural materials to approved recycling facilities.*
Disposal Fees and Taxes	279,805.0	ton	$62.45	$17,474,523	*Fees/taxes for disposal of waste at approved disposal facilities. Market value of recycled building structural materials.*

Feasibility Study Comparison Estimate

Cost Estimate Item / Activity	Quantity	Unit of Measure	Unit cost	Total	Notes
Site Restoration					
Earthwork	57,409.0	cy	$56.44	$3,240,213	*Includes purchase, delivery, spreading, and compaction of off-site unclassified fill. Includes purchase, delivery and spreading of off-site topsoil.*
Permanent Features	500.0	lf	$82.88	$41,442	*Replacing 500lf of chain-link fencing; includes (2) 14ft wide gates*
Revegetation and Planting	23.2	acre	$14,796.03	$343,268	*Seeding, fertilizing and mulching of 23.2 acres post construction*
Demobilization					
Removal of Temporary Facilities					
Office Trailers	5.0	ea	$2,197.57	$10,988	*Trailers: (1) dbl-wide contractor, (1) dbl-wide operations, (1) health physics trailer*
Storage Facilities	2.0	ea	$1,636.57	$3,273	*(2) 40' x 8' storage containers*
Decontamination Facilities for Personnel	2.0	ea	$13,418.23	$26,836	*(2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable, grey) - trailers and tanks will be decontaminated prior to removal from the site*
Decontamination Facilities for Construction Equipment / Vehicles	80.0	lcy	$77.31	$6,185	*Removal of 20 'x 50' lined asphalt construction equipment decontamination pad*
Lunch / Break Trailer (Craft Labor)	1.0	ea	$4,317.43	$4,317	*Removal of (1) dbl-wide crew break trailer*
Toilets	5.0	ea	$134.12	$671	*Removal of (5) portable toilets*
Government Trailers (USACE Office)	1.0	ea	$2,353.01	$2,353	*Removal of single-wide trailer for USACE personnel*
Guard Houses	1.0	ea	$2,140.31	$2,140	*Removal of 20' x 8' trailer at site entrance for security guard*
Truck Scales	1.0	ea	$7,672.74	$7,673	*Removal of 60' x 10' 50 ton portable truck scale - scale will be decontaminated prior to removal from site*
Wastewater Holding Tanks - Wastewater Treatment Plant (WWTP)	1.0	ls	$29,335.63	$29,336	*Removal of sand filtration and carbon absorption system for site water treatment*
Erosion Control	1.0	ls	$10,369.94	$10,370	*Removal of all erosion control measures*
Interim Stockpile Pad	120.0	lcy	$77.31	$9,277	*Excavation and removal of 50' x 50' lined asphalt stockpile pad*
Final Decontamination					
Remove Media and Decontaminate WWTP Equipment	1.0	ls	$37,807.72	$37,808	*Remove, transport and dispose of site water treatment media. Tanks and equipment will be decontaminated prior to removal from site*
Decontaminate Construction Equipment	29.0	ea	$10,081.86	$292,374	*Decontamination of construction equipment prior to removal from the site*
Demobilize Construction Equipment					
Vehicle loads (small to large)	38.0	ea	$1,476.59	$56,110	*38 loads / pieces on flatbed transport*
Submittals					
Construction Documentation Report	1.0	ea	$80,178.27	$80,178	*Draft, ITR, agency review, response and final*
General Requirements					
Supervision and Management					
Program Manager	35.0	mo	$5,324.29	$186,350	*Program Manager dedicated 25% to project, located at home office*
Project Manager	35.0	mo	$9,453.29	$330,865	*Project Manager dedicated 50% to project, located at home office, visits project site every other month for two days each trip*
Site Superintendent	35.0	mo	$17,847.83	$624,674	*Site Superintendent dedicated 100% to project, located at project site, one weekend trip home each month*
Vehicles, Travel and Per Diem	35.0	mo	$13,278.88	$464,761	*Vehicles, travel, and per diem for Project Manager and Site Superintendent*
Administration Job Office					
Clerk/Typist/Receptionist	35.0	mo	$7,241.30	$253,446	*Clerk/Typist/Receptionist dedicated 100% to project, located at project site, local hire*
Computer Technician	35.0	mo	$4,829.72	$169,040	*Computer Technician dedicated 50% to project, located at project site, local hire*
Office Supplies	35.0	mo	$78.58	$2,750	*Ten reams of copier/printer paper per month*
Engineering, Surveying, and Quality Control					
Civil Engineer	35.0	mo	$17,595.13	$615,829	*Civil Engineer dedicated 100% to project, located at project site, local hire*
Surveyors	35.0	mo	$7,261.12	$254,139	*Survey crew consisting of Surveyor III and Surveyor I, working average of 25% on project, includes survey instruments and truck*
Waste Manager	35.0	mo	$17,084.28	$597,950	*Waste Manager dedicated 100% to project, located at project site, local hire*
Quality Control Manager	35.0	mo	$17,001.78	$595,062	*Quality Control Manager dedicated 100% to project, located at project site, one weekend trip home each month*
Data Acquisition Manager	35.0	mo	$25,357.09	$887,498	*Data Acquisition Manager dedicated 100% to project, located at project site, one weekend trip home each month*
Vehicles, Travel and Per Diem	35.0	mo	$19,524.39	$683,354	*Vehicles, travel, and per diem for Quality Control Manager and Data Acquisition Manager*
First Aid, Fire Protection, Traffic Control and Security					
Water Truck and Driver	35.0	mo	$25,157.90	$880,527	*3,000 gallon water truck and truck driver operated 40 hours/week*
Guard	35.0	mo	$5,138.88	$179,861	*Guard at entrance gate 40 hours/week, local hire*
Health & Safety					
Safety & Health Manager	35.0	mo	$8,152.46	$285,336	*Safety & Health Manager dedicated 50% to project, located at home office, visits project site every other month for two days each trip*
Radiation Safety Officer	35.0	mo	$28,715.70	$1,005,049	*Radiation Safety Officer dedicated 100% to project, located at project site, one weekend trip home each month*

Radiation Monitoring	1.0	ls	$64,241.07	$64,241	*Radiation technician w/instrumentation monitoring well replacements/decommissioning; groundwater extraction pump replacements; extraction well replacement; extraction wells/sumps decommissioning*
Monitoring Wells					
Replace 2 monitoring wells	1.0	ls	$58,178.72	$58,179	*Replace 2 monitoring wells every 5 years, years 5 - 25*
Decommission all monitoring wells	1.0	ls	$11,155.84	$11,156	*Decommission 26 shallow and 14 deep monitoring wells at end of year 30*
Sampling Surface Water / Groundwater	1.0	ls	$189,959.43	$189,959	*Sample five (5) seep locations annually for 130 years. Sample 26 shallow and 14 deep monitoring wells, 5 trench extraction sumps, and treatment system influent and effluent as follows: semi-annually for first 3 years, annually years 4 & 5, every 5 years years 10 - 30*
Laboratory Chemical Analysis	1.0	ls	$626,141.59	$626,142	*Analyze seep, monitoring well, trench extraction sump, and treatment system influent/effluent samples for volatile organic compounds*
Radioactive Waste Analysis	1.0	ls	$384,187.09	$384,187	*Analyze seep, monitoring well, trench extraction sumo, and treatment system influent/effluent samples for total uranium and uranium isotopes*
Five-Year Reviews	1.0	ls	$302,229.48	$302,229	*Perform Five-Year Review every 5 years, years 5 - 30*
Groundwater Collection and Control					
Extraction Wells	1.0	ls	$433,438.19	$433,438	*Replace all groundwater extraction pumps every 5 years, years 5 - 25; replace two (2) groundwater extraction wells every 5 years, years 5 - 25; decommission seven (7) shallow and three (3) extraction wells and five (5) extraction sumps at end of year 30*
Drums/Tanks/ Structures/Miscellaneous Demolition and Removal					
Structure Removal	1.0	ls	$23,683.37	$23,683	*Demolish Groundwater Treatment Facility at end of year 30.*
Chemical Treatment					
Groundwater Treatment Facility	1.0	ls	$6,224,068.97	$6,224,069	*Operation & maintenance of Groundwater Treatment Facility, years 1-30*
Disposal (Other than Commercial)					
Groundwater Treatment Facility Effluent	1.0	ls	$3,981,120.23	$3,981,120	*Groundwater Treatment Facility effluent discharged to the industrial sewer line/City of Lockport POTW, years 1-30*
Disposal (Commercial)					
Groundwater Treatment Facility Spent Ion Resin	1.0	ls	$89,273.02	$89,273	*Annual change-out of 25 CF of resin per each of five (5) 2-bed co-current demineralizers, years 1-30.*
Drill Cuttings - Monitoring Wells	1.0	ls	$14,876.15	$14,876	*Replace two (2) monitoring wells every 5 years, years 5-25; decommission 26 shallow and 14 deep monitoring wells at the end of year 30*
Drill Cuttings - Extraction Wells/Sumps	1.0	ls	$14,849.44	$14,849	*Replace two (2) extraction wells every 5 years, years 5-25; decommission seven (7) shallow and three (3) deep extraction wells, and five (5) extraction trench sumps at the end of year 30*
Groundwater Treatment Facility Building Contents and Building Structural Materials	1.0	ls	$153,928.13	$153,928	*Demolish Groundwater Treatment Facility at the end of year 30*
Demobilization					
Final Decontamination	1.0	ls	$21,806.35	$21,806	*Decontaminate drilling equipment every 5 years, years 5-25*
Demobilize Construction Equipment	1.0	ls	$2,023.66	$2,024	*6 loads / pieces on flatbed transport at end of year 30*
Submittals	1.0	ls	$8,442.20	$8,442	*Construction DocumentationReport at end of year 30*

Sampling and Analysis Plan	1.0	ea	$64,440.38	$64,440	*Draft, ITR, agency review, response and final*
Demolition Plan	1.0	ea	$28,830.50	$28,831	*Draft, ITR, agency review, response and final*
Radiation Protection Plan	1.0	ea	$41,127.27	$41,127	*Draft, ITR, agency review, response and final*
Site Restoration Plan	1.0	ea	$27,049.34	$27,049	*Draft, ITR, agency review, response and final*
Setup / Construct Temporary Facilities					
Office Trailers	5.0	ea	$8,074.53	$40,373	*Trailers: (1) dbl-wide contractor, (1) dbl-wide operations, (1) health physics trailer*
Storage Facilities	2.0	ea	$1,636.57	$3,273	*(2) 40' x 8' storage containers*
Decontamination Facilities for Personnel	2.0	ea	$11,405.68	$22,811	*(2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable, grey)*
Decontamination Facilities for Construction Equipment / Vehicles	1,000.0	sf	$28.56	$28,558	*20 'x 50' lined asphalt construction equipment decontamination pad (includes site prep and decontamination equip)*
Lunch / Break Trailer (Craft Labor)	1.0	ea	$15,725.10	$15,725	*(1) dbl-wide crew break trailer (includes hook-ups, tables and chairs)*
Toilets	5.0	ea	$134.12	$671	*(5) portable toilets*
Government Trailers (USACE Office)	1.0	ea	$6,889.82	$6,890	*(1) single-wide trailer for USACE personnel (incl. hook-ups, furniture)*
Guard Houses	1.0	ea	$5,452.42	$5,452	*20' x 8' trailer at site entrance for security guard (incl. hook-ups, furniture)*
Truck Scales	1.0	ea	$49,890.02	$49,890	*60' x 10' 50 ton portable truck scale (incl. electric hookup)*
Wastewater Holding Tanks	1.0	ls	$172,305.77	$172,306	*Sand filtration and carbon absorption system for site water treatment*
Security Fencing	1,000.0	lf	$62.09	$62,088	*Install 1000lf of 8' chain link fencing around project site*
Signs	1.0	ls	$5,091.16	$5,091	*Project sign, safety sign, bulletin board, and (20) warning signs*
Erosion Control	5,000.0	lf	$5.55	$27,765	*Install 5,000lf of silt fencing and 1,000lf of hay bales for erosion control*
Interim Stockpile Pad	2,500.0	sf	$13.98	$34,953	*50' x 50' lined asphalt stockpile pad (includes site prep)*
Monitoring, Sampling, Testing, and Analysis					
Meteorological Monitoring	2.0	ea	$4,540.59	$9,081	*(2) meteorological stations with power*
Radiation Monitoring	1.0	ls	$1,614,242.53	$1,614,243	*Includes baseline radiological survey, radiological monitoring of building decontamination / dismantlement, impacted soils excavation, and incoming/outgoing materials*
Air Monitoring and Sampling	25.0	mo	$29,918.29	$747,957	*Perimeter (six locations and one off-site background) and work area (two locations) air monitoring at project site*
Sampling Surface Water / Groundwater / Liquid Waste	25.0	mo	$1,889.30	$47,233	*Sampling site surface water, excavation water, and site water treatment effluent*
Sampling Soil and Sediment	1.0	ls	$33,558.09	$33,558	*Post-excavation confirmatory soil sampling, off-site unclassified fill and topsoil sampling*
Sampling Radioactive Contaminated Media	1.0	ls	$359,784.32	$359,784	*Sampling impacted soils, building contents and building debris for waste acceptance criteria analysis*
Laboratory Chemical Analysis	1.0	ls	$232,745.82	$232,746	*Off-site quality assurance chemical analysis of one sample in ten for: site surface water, excavation water, site water treament effluent, impacted soils waste acceptance, and off-site unclassified fill and topsoil*
Radioactive Waste Analysis	1.0	ls	$809,397.71	$809,398	*Off-site radiological analysis of perimeter and work area air monitoring samples. Off-site quality assurance radiological analysis of one sample in ten for: site surface water, excavation water, site water treatment effluent, post-excavation confirmatory soil samples, impacted soils for waste acceptance, offsite unclassified fill and topsoil samples.*
Geotechnical Testing	1.0	ls	$9,499.72	$9,500	*Off-site classification testing of off-site unclassified fill, nuclear density testing of placed and compacted off-site unclassified fill (excavation backfill)*
On-Site Laboratory Facilities	25.0	mo	$233,562.18	$5,839,055	*Mobilization, rental, operation, and demobilization of temporary on-site ELAP certified radiological and chemical analysis laboratory*
Site Work					
Demolition	500.0	lf	$6.51	$3,254	*Demolition of 500 lf of chain-link fencing and two 14-ft wide gates*
Clearing and Grubbing	3.2	acre	$1,849.02	$5,954	*Clearing and grubbing 3.2 acres of brush, stumps and light trees*
Roads/Parking/Curbs/Walks	50,000.0	sf	$1.57	$78,625	*Construction of 2,500 LF of 20-ft wide x 1-ft thick aggregate haul road(s)*
Surface Water Collection and Control					
Sediment Barriers	25.0	mo	$7,065.16	$176,629	*Weekly inspection and repair of silt fencing and hay bales*
Solids Collection and Containment					
Contaminated Soil Collection	4,990.0	BCY	$152.72	$762,069	*Excavation, on-site hauling, stockpiling and loading for disposal*
Liquids / Sediments / Sludge Collection and Containment					
Waste water treatment plant (WWTP) startup and performance testing	1.0	ls	$33,319.15	$33,319	*Includes startup process and testing for site water treatment plant*
Treatment Plant Operation	25.0	mo	$30,763.21	$769,080	*Operation of site water treatment plant*

Feasibility Study Comparison Estimate

Cost Estimate Item / Activity	Quantity	Unit of Measure	Unit cost	Total	Notes
Drums / Tanks / Structures / Miscellaneous Demolition and Removal					
Decontamination					
Decontamination - Building 1	4,260.0	sf	$4.14	$17,657	*Reinforce ~700 SF of Bldg. 1 floor; 0Contaminant removal by grinding/scabbling (50% of radiologically impacted surface), metal blasting (50% of radiologically impacted surface), HEPA vacuuming (100% of radiologically impacted surface), and pressure washing (100% of radiologically impacted surface)*
Decontamination - Building 2	79,710.0	sf	$2.05	$163,356	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 3	61,140.0	sf	$2.05	$125,271	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 4/9	48,240.0	sf	$2.05	$98,862	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 5	4,500.0	sf	$2.04	$9,195	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 6	14,180.0	sf	$2.05	$29,043	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Decontamination - Building 8	28,300.0	sf	$2.05	$57,968	*Limited contaminant removal by grinding/scabbling (5% of total bldg area), metal blasting (5% of total bldg area) and HEPA vacuuming (25% of total bldg area)*
Dismantlement					
Building 1	8,800.0	sf	$6.00	$52,786	*Removal of PACM, misc. equipment, and misc. debris*
Dismantlement - Building 2	68,900.0	sf	$33.56	$2,312,021	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 3	67,400.0	sf	$32.25	$2,173,521	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 4/9	47,400.0	sf	$34.91	$1,654,709	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 5	3,800.0	sf	$36.32	$138,030	*Removal of misc. equipment and mechanical structure dismantlement*
Dismantlement - Building 6	15,100.0	sf	$45.86	$692,413	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Dismantlement - Building 8	27,900.0	sf	$46.72	$1,303,476	*Removal of PACM, misc. equipment, misc. debris, and mechanical structure dismantlement*
Disposal (Commercial)					
Container Handling	1.0	ls	$603,725.14	$603,725	*On-site handling of Containers for building debris, impacted soils, decon pad and interim stockpile pad material*
Transportation to Storage/Disposal Facility	176,343.0	ton	$112.59	$19,854,428	*Transportation of waste to approved disposal facilities. Transportation of building structural materials to approved recycling facilities.*
Disposal Fees and Taxes	176,343.0	ton	$27.77	$4,896,761	*Fees/taxes for disposal of waste at approved disposal facilities. Market value of recycled building structural materials.*
Site Restoration					
Earthwork	4,990.0	cy	$64.06	$319,641	*Includes purchase, delivery, spreading, and compaction of off-site unclassified fill. Includes purchase, delivery and spreading of off-site topsoil.*
Permanent Features	500.0	lf	$82.88	$41,442	*Replacing 500lf of chain-link fencing; includes (2) 14ft wide gates*
Revegetation and Planting	3.2	acre	$14,796.03	$47,347	*Seeding, fertilizing and mulching of 3.2 acres post construction*
Demobilization					
Removal of Temporary Facilities					
Office Trailers	5.0	ea	$2,197.57	$10,988	*Trailers: (1) dbl-wide contractor, (1) dbl-wide operations, (1) health physics trailer*
Storage Facilities	2.0	ea	$1,636.57	$3,273	*(2) 40' x 8' storage containers*
Decontamination Facilities for Personnel	2.0	ea	$13,418.23	$26,836	*(2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable, grey) - trailers and tanks will be decontaminated prior to removal from the site*
Decontamination Facilities for Construction Equipment / Vehicles	80.0	lcy	$77.31	$6,185	*Removal of 20 'x 50' lined asphalt construction equipment decontamination pad*
Lunch / Break Trailer (Craft Labor)	1.0	ea	$4,317.43	$4,317	*Removal of (1) dbl-wide crew break trailer*
Toilets	5.0	ea	$134.12	$671	*Removal of (5) portable toilets*
Government Trailers (USACE Office)	1.0	ea	$2,353.01	$2,353	*Removal of single-wide trailer for USACE personnel*
Guard Houses	1.0	ea	$2,140.31	$2,140	*Removal of 20' x 8' trailer at site entrance for security guard*
Truck Scales	1.0	ea	$7,672.74	$7,673	*Removal of 60' x 10' 50 ton portable truck scale - scale will be decontaminated prior to removal from site*
Wastewater Holding Tanks - Wastewater Treatment Plant (WWTP)	1.0	ls	$29,335.63	$29,336	*Removal of sand filtration and carbon absorption system for site water treatment*
Erosion Control	1.0	ls	$10,369.94	$10,370	*Removal of all erosion control measures*
Interim Stockpile Pad	120.0	lcy	$77.31	$9,277	*Excavation and removal of 50' x 50' lined asphalt stockpile pad*

Administration Job Office					
Clerk/Typist/Receptionist	25.0	mo	$7,241.30	$181,033	*Clerk/Typist/Receptionist dedicated 100% to project, located at project site, local hire*
Computer Technician	25.0	mo	$4,829.72	$120,743	*Computer Technician dedicated 50% to project, located at project site, local hire*
Office Supplies	25.0	mo	$78.58	$1,964	*Ten reams of copier/printer paper per month*
Engineering, Surveying, and Quality Control					
Civil Engineer	25.0	mo	$17,595.13	$439,878	*Civil Engineer dedicated 100% to project, located at project site, local hire*
Surveyors	25.0	mo	$7,255.37	$181,384	*Survey crew consisting of Surveyor III and Surveyor I, working average of 25% on project, includes survey instruments and truck*
Waste Manager	25.0	mo	$17,084.28	$427,107	*Waste Manager dedicated 100% to project, located at project site, local hire*
Quality Control Manager	25.0	mo	$17,001.78	$425,044	*Quality Control Manager dedicated 100% to project, located at project site, one weekend trip home each month*
Data Acquisition Manager	25.0	mo	$25,357.09	$633,927	*Data Acquisition Manager dedicated 100% to project, located at project site, one weekend trip home each month*
Vehicles, Travel and Per Diem	25.0	mo	$19,523.42	$488,085	*Vehicles, travel, and per diem for Quality Control Manager and Data Acquisition Manager*
First Aid, Fire Protection, Traffic Control and Security					
Water Truck and Driver	25.0	mo	$25,157.90	$628,948	*3,000 gallon water truck and truck driver operated 40 hours/week*
Guard	25.0	mo	$5,138.88	$128,472	*Guard at entrance gate 40 hours/week, local hire*
Health & Safety					
Safety & Health Manager	25.0	mo	$8,152.46	$203,811	*Safety & Health Manager dedicated 50% to project, located at home office, visits project site every other month for two days each trip*
Radiation Safety Officer	25.0	mo	$28,715.70	$717,893	*Radiation Safety Officer dedicated 100% to project, located at project site, one weekend trip home each month*
Site Safety & Health Officer	25.0	mo	$19,547.63	$488,691	*Site Safety & Health Officer dedicated 100% to project, located at project site, one weekend trip home each month*
Health & Safety Training	2.0	yr	$56,712.44	$113,425	*Radiation safety and site-specific safety training for all site workers*
Health & Safety Medical Exams	1.0	ls	$135,536.79	$135,537	*Entry and exit medial physicals/drug screening for all site workers*
Personal Protective Equipmnt	1.0	ls	$2,379,929.65	$2,379,930	*Protective clothing, respirators, supplied air, etc.*
Vehicles, Travel and Per Diem	25.0	mo	$29,779.48	$744,487	*Vehicles, travel, and per diem for Safety & Health Manager, Radiation Safety Officer, and Site Safety & Health Officer*
Temporary Construction Facilities - Ownership					
Office Trailers	25.0	mo	$2,370.85	$59,271	*Monthly rental: (1) dbl-wide contractor trailer, (1) dbl-wide operations trailer, (1) health physics trailer*
Warehouse and Storage Trailers	25.0	mo	$292.63	$7,316	*Monthly rental: (2) 40' x 8' storage containers*
Guard House	25.0	mo	$261.47	$6,537	*Monthly rental: 20' x 8' trailer at site entrance for security guard*
Portable Toilets	25.0	mo	$134.12	$3,353	*Monthly rental: (5) portable toilets*
Personnel Decontamination Facilities	25.0	mo	$10,131.95	$253,299	*Monthly rental: (2) 24' x 8' decontamination trailers, (2) 4,000 gal tanks (potable,*
Break Trailers	25.0	mo	$948.34	$23,709	*Monthly rental: (1) dbl-wide crew break trailer*
Government Trailers	25.0	mo	$474.17	$11,854	*Monthly rental: (1) single-wide trailer for USACE personnel*
Temporary Construction Facilities - Operation					
Janitors and Cleaning Services	25.0	mo	$4,631.82	$115,795	*Weekly cleaning 11 trailers*
Haul Road Maintenance	25.0	mo	$1,066.89	$26,672	*Provide,spread and compact 25 LCY of gravel/month to maintain haul road*
Project Utilities					
Telephone	25.0	mo	$4,305.50	$107,637	*Monthly site telephone usage charge*
Electrical	25.0	mo	$1,403.91	$35,098	*Monthly site electrical usage charge*
Water	25.0	mo	$270.70	$6,768	*Monthly site water usage charge*
Internet	25.0	mo	$846.55	$21,164	*Monthly site internet usage charge*
Supervision & Administration (S&A) Construction Management					
USACE Labor & Contracts	43.0	mo	$125,000.00	$5,375,000	*$125,000 labor cost per month during remediation*
FISCAL / FINANCIAL CLOSEOUT ACTIVITIES					
USACE Labor & Contracts	2.0	yr	$500,000.00	$1,000,000	*$500,000 labor cost per year for two year closeout period at end of RA*

1.0 INTRODUCTION AND BACKGROUND

In 1997, Congress designated the United States Army Corps of Engineers (USACE) as the lead federal agency for implementing the Formerly Utilized Sites Remedial Action Program (FUSRAP) according to protocols set forth in the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, applying the standard criteria set forth in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). The U.S. Department of Energy (DOE) designated the former Guterl Specialty Steel Corporation Site for inclusion in FUSRAP; and the USACE-Buffalo District is the lead district for the Guterl Site, responsible for conducting a remedial investigation/feasibility study (RI/FS) at the site pursuant to CERCLA and the NCP.

The Guterl FUSRAP Site is located in the City of Lockport, Niagara County, New York, approximately 32 kilometers (km) [20 miles (mi)] northeast of Buffalo, New York. The Guterl Site is grouped into two areas:

- The 24.5 hectare (ha) [60.6 acre (ac)] property currently owned and operated by ATI Specialty Materials (formerly Allegheny Ludlum Corporation) and a 3.5 ha (8.6 ac) inactive hazardous waste disposal area owned by ATI Specialty Materials, located in the northwest corner of the site
- The 3.6 ha (9 ac) excised property (known as the Excised Area), owned by Guterl Specialty Steel and located in the southeast corner of the site.

From 1948 to 1952, the Guterl Site was used by Simonds Saw and Steel (Simonds) to process uranium metal and, to a much smaller extent, thorium metal for the New York Operations Office of the Atomic Energy Commission. Guterl Specialty Steel Corporation acquired the property in 1978. In 1982, the Guterl Specialty Steel Corporation filed for Chapter 11 bankruptcy protection in the U.S. Bankruptcy Court for the Western District of Pennsylvania (this was changed to a Chapter 7 bankruptcy in 1990). In 1984, using industrial development bonds received through the Niagara County Industrial Development Agency, the Allegheny Ludlum Corporation purchased the Guterl Specialty Steel Corporation assets at an auction (U.S. Bankruptcy Court, 1984). The purchase included all of the Guterl Specialty Steel Corporation property, with the exception of nine acres of land, later known as the Excised Area, and equipment utilized during Atomic Energy Commission-related operations at the Guterl Site. As a result, the Excised Area and equipment therein remains under ownership of Guterl Specialty Steel Corporation (a Chapter 7 bankrupt corporation). In 1996, the Allegheny Ludlum Corporation merged with Teledyne Incorporated to form Allegheny Technologies Incorporated (ATI). The Guterl Site, with the exception of the Excised Area, is currently owned and operated by ATI under the name ATI Specialty Materials.

ATI Specialty Materials operates an active specialty materials manufacturing facility in the southwest portion of the 24.5 hectare (ha) [60.6 acre (ac)] ATI property. The 3.5 ha (8.6 ac) inactive hazardous waste disposal area is no longer operated as a waste disposal area (since 1981). The 3.6 ha (9 ac) Excised Area, which contains the buildings once used to roll uranium metal, is abandoned with chain link security fence surrounding the dormant buildings.

There are 14 buildings located on the Guterl Site: 9 abandoned buildings in the Excised Area (Buildings 1, 2, 3, 4/9, 5, 6, 8 and 35) and 5 buildings owned by ATI Specialty Materials (Buildings 14, 17, 24, 37, and 47). Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) activities at the Guterl Site have transitioned from the site remedial investigation (RI) activities to the feasibility study (FS) evaluation of potential remediation alternatives to address FUSRAP-related constituents of concern (COCs) in soil, groundwater, and on building surfaces.

The purpose of this appendix is to identify potential Applicable or Relevant and Appropriate Requirements (ARARs) for the Guterl Site.

Section 121 (d) "*Degree of cleanup*" of CERCLA directs that any remedial action selected shall attain a degree of cleanup of hazardous substances, pollutants, and contaminants released into the environment, or control of further release, that at a minimum assures the protection of human health and the environment. Such remedial actions shall also be relevant and appropriate under the circumstances *presented by the release* or threatened release of such substance, pollutant, or contaminant. With respect to any hazardous substance, pollutant or contaminant *that will remain on-site* the remedy selected shall attain a standard, requirement, criteria or limitation under any federal environmental law *or* any promulgated standard, requirement, criteria, or limitation under a state environmental or facility siting law that is more stringent than the federal standard, and has been identified by the state in a timely manner, which is legally applicable to the hazardous substance or pollutant or contaminant concerned *or* is relevant and appropriate under the *circumstances of the release* or threatened release of such hazardous substance, pollutant, or contaminant. The statute puts the emphasis on the degree of cleanup, or in other words, how clean is clean enough if a hazardous substance, pollutant, or contaminant remains at the site.

The United States Environmental Protection Agency (U.S. EPA) articulated its interpretation of this section of CERCLA in the NCP and defined these standards as ARARs at 40 Code of Federal Regulations (CFR) 300.5. Applicable requirements means those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site. Only those state standards that are identified by a state in a timely manner and that are more stringent than federal requirements may be applicable. Relevant and appropriate requirements means those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that, while not *applicable* to a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site. Only those state standards that are identified in a timely manner and are more stringent than federal requirements may be relevant and appropriate.

1.1 Historical Use of the Guterl Site

Records indicate that Simonds processed between 25 million and 35 million pounds of natural uranium metal (i.e., processed uranium metal without enrichment supplied as metal ingots) and approximately 30,000 to 40,000 pounds of thorium between 1948 and 1956 (ORISE, 1999).

Previous investigations have established that more than 99 percent of all material processed by Simonds was natural uranium; i.e., uranium that has not been enriched or depleted and with uranium isotopic ratios consistent with naturally occurring abundances (NIOSH, 2005). However, there is evidence to support that during the latter portions of the contract work small quantities of depleted and enriched uranium (up to 2.5 percent) were processed at the Guterl Site. Of the thorium that was processed, ^{228}Th and ^{232}Th were present in equal fractions.

Atomic Energy Commission (AEC)-related operations at the Guterl Site were mostly limited to buildings located within the Excised Area (Buildings 1, 2, 3, 4/9, 5, 6, 8 and 35). The majority of AEC support operations involved the processing of uranium metal through the 16-inch mills in Buildings 6 and 8; thorium was also processed, to a lesser extent, during the latter part of the contract period. On average, the AEC materials were processed one week per month over the period of 1948 through 1956.

AEC support operations outside of the Excised Area included building 17 and the southwest portion of building 24. Building 17 was used as a former metallurgy laboratory and is currently owned by ATI Specialty Materials. The southwest portion of building 24 was constructed in 1941 and was used for AEC support operations. A small (13.72 meter x 15.24 meter [45 feet × 50 feet]) addition was built in 1951 onto the north end of the original 1941 structure. The addition of what is currently the southeast portion of the building was completed in 1959; this addition "squared off" the 1941-1951 footprint, extending building 24 from building 8 to the north end of the 1951 addition. A final northern addition was completed in 1966 that matched the full width of the then-existing building. Building 24 is an active warehouse facility for ATI Specialty Materials.

1.2 Extent of FUSRAP Contamination in Soils, Buildings, and Groundwater

The constituents of concern (COCs) for which soil cleanup goals will be developed in the FS are ^{232}Th (and associated short-lived daughter products ^{228}Ra and ^{228}Th, which are assumed to be in equilibrium with ^{232}Th), total uranium (including ^{234}U, ^{235}U, and ^{238}U), and ^{238}U as a surrogate for the total uranium derived concentration levels. The COCs for building materials are the same as those listed above for soil. The COC for groundwater is total uranium (including ^{234}U, ^{235}U, and ^{238}U).

1.3 Remedial Action Objectives

A remedial action objective (RAO) is a specific goal that remedial alternatives must fulfill to be protective of human health and the environment. Remedial action objectives provide the basis for selecting remedial technologies and developing and evaluating remedial alternatives.

The RAOs for the Guterl Site are:

- Prevent exposure to uranium and ^{232}Th in soil and buildings; and uranium in groundwater; such that a construction worker does not receive a total effective dose exceeding 25 millirem/year (mrem/yr) above background from all pathways.
- Comply with the Maximum Contaminant Level (MCL) of 30 micrograms per liter (µg/L) in groundwater that is a potential source of drinking water.

1.4 Preliminary Remediation Goals

Preliminary remediation goals (PRGs) for soil were developed based on two endpoints:

(1) Protection of direct soil exposures to the critical group (a construction worker) for the reasonable future land use (industrial).
(2) Protection of groundwater (i.e., removal of enough of the uranium soil source term to allow attenuation of uranium groundwater concentrations to the U.S. EPA MCL for protection of drinking water).

The two sets of soil PRGs, and soil background concentrations for each COC, are provided in Table 3-1, and discussed in detail in the following two sections.

The construction worker PRG, designated as soil PRG-CW, was developed to meet the 25 mrem/year dose limit (as per 10 CFR 20 Section 20.1402), considering all exposure pathways. The soil PRG-CW is defined as 23 pCi/g for ^{238}U and 6.6 pCi/g for ^{232}Th. The isotope ^{238}U will be used as a surrogate for the total uranium soil PRG-CW because it can be directly measured in the field during remediation efforts.

The modeling calculation of the groundwater protection PRG for soil, designated as soil PRG-GW, indicate a soil PRG-GW of 11 milligrams per kilogram (mg/kg) total uranium (equivalent to 3.66 pCi/g ^{238}U) is predicted to be protective of groundwater. Based on the results of the groundwater flow model, uranium will attenuate to meet the MCL (30 µg/L) throughout the majority of the site within 120 years, respectively.

1.5 Remedial Alternatives for the Guterl Site

The USACE identified four site-wide remedial action alternatives for detailed analysis to address FUSRAP-related COCs in soil, groundwater, and on building surfaces at the Guterl Site.

Site-Wide Alternative 1—No Action.

Under this alternative, no action would be taken for buildings, soil, or groundwater/seeps impacted at the site. Since no actions are taken under this alternative to address risk, it is not considered protective of human health and the environment. However, the no-action alternative is carried over as a baseline for comparison to the other alternatives, as required by the NCP [40 CFR §300.430(e)(6)]. The groundwater model developed for this FS predicts it will take more than 1,000 years to reach the MCL.

Site-Wide Alternative 2—Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, 24 and 35; Complete Soil Removal to Soil PRG-Groundwater and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring and Land Use Controls (LUCs).

Under this alternative Buildings 1, 2, 3, 4/9, 5, 6, 8, 24 and 35 would be dismantled. The dismantlement of building 24 and the remediation of underlying soils will be conducted at the time of the site-wide remedial action with property owner permission to dismantle the building. If building 24 is not available or authorized for dismantlement at the time of the site-wide remedial action, the inaccessible contamination and building 24 will remain until it becomes

available under a change of site conditions. Soils impacted above the Soil PRG-GW (11 milligrams per kilogram [mg/kg] total uranium [equivalent to 3.66 pCi/g ^{238}U] and 6.6 pCi/g for ^{232}Th), a soil cleanup level developed to protect continued impacts to groundwater above the MCL for uranium, would be removed. Building materials and impacted soils would then be disposed off-site. Uranium in groundwater would be addressed through monitored natural attenuation (MNA). The groundwater model developed predicts that the concentrations in the groundwater below the site will achieve the MCL in approximately 120 years. LUCs would be put in place for groundwater, primarily through long-term deed restrictions, until MCLs are achieved. Environmental monitoring would be used to document the performance of this alternative, which includes collection of groundwater and seep samples.

<u>Site-Wide Alternative 3</u>—Dismantlement and Off-Site Disposal of Buildings 1, 2, 3, 4/9, 5, 6, 8, 24, and 35; Complete Soil Removal to the Soil PRG-GW and Off-Site Disposal; Groundwater Recovery Using Vertical Wells and a Rubblized Trench with *Ex Situ* Treatment, Environmental Monitoring, and LUCs

Under this alternative, Buildings 1, 2, 3, 4/9, 5, 6, 8, 24 and 35 would be dismantled, and limited decontamination of the buildings/contents would be performed. The dismantlement of building 24 and the remediation of underlying soils will be conducted at the time of the site-wide remedial action with property owner permission to dismantle the building. If building 24 is not available or authorized for dismantlement at the time of the site-wide remedial action, the inaccessible contamination and building 24 will remain until it becomes available under a change of site conditions. Soils impacted above the Soil PRG-GW (11 milligrams per kilogram [mg/kg] total uranium and 6.6 pCi/g for ^{232}Th) would be removed. Building materials and impacted soils would then be disposed off-site. Uranium in groundwater would be addressed through groundwater recovery using a series of vertical wells and a rubblized trench along the southeastern property boundary combined with *ex situ* treatment and off-site disposal. The groundwater model predicts it will take approximately 30 years for the uranium concentrations in groundwater to achieve the MCL. Land use controls would be put in place for groundwater, primarily through short-term deed restrictions, until MCLs are achieved. Environmental monitoring would be used to document the performance of this alternative, which includes collection of groundwater and seep samples.

<u>Site-Wide Alternative 4</u>— Decontamination of Building 1; Dismantlement and Off-Site Disposal of Buildings 2, 3, 4/9, 5, 6, 8, and 24; Complete Soil Removal to the Soil PRG-CW and Off-Site Disposal; Monitored Natural Attenuation with Environmental Monitoring and Land Use Controls

Under this alternative, building 1, which has limited portions of the structure impacted, will be decontaminated. Soils underlying building 1 are not impact above the PRG-CW. Buildings 2, 3, 4/9, 5, 6, 8, and 24 would be dismantled, and limited decontamination of the buildings/contents would be performed. The dismantlement of building 24 and the remediation of underlying soils will be conducted at the time of the site-wide remedial action with property owner permission to dismantle the building. If building 24 is not available or authorized for dismantlement at the time of the site-wide remedial action, the inaccessible contamination and building 24 will remain until it becomes available under a change of site conditions. Soils impacted above the Soil PRG-CW (23 pCi/g for ^{238}U and 6.6 pCi/g for ^{232}Th), a soil cleanup level developed to be protective of

the construction worker, would be removed. Building materials and impacted soils would then be disposed off-site. Uranium in groundwater would be addressed through MNA. The groundwater model developed for this FS predicts that the groundwater concentrations in the groundwater below the site will achieve the MCL in approximately 660 years. LUCs would be put in place for groundwater, primarily through deed restrictions, until MCLs are achieved. Environmental monitoring would be used to document the performance of this alternative, which includes collection of groundwater and seep samples.

1.6 Appendix Organization and Content

This appendix is composed of the following sections:

- Section 1.0 describes the history and contents of the Guterl Site, risks posed by FUSRAP-related COCs at the Guterl Site, as well as remedial action objectives and remedial alternatives for the Guterl Site.
- Section 2.0 presents an overview of the process for identifying ARARs, per CERCLA.
- Section 3.0 discusses the ARARs identified for the Guterl Site.
- Section 4.0 discusses the regulations that were determined not to be ARARs.
- Section 5.0 lists all of the references cited within this appendix.

2.0 PROCESS FOR IDENTIFYING APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

This section describes the general process used to identify and evaluate ARARs. It presents a brief overview of how ARARs support the CERCLA remedy selection process and describes the factors that must be considered during development of ARARs.

Applicable or Relevant and Appropriate Requirements are developed in accordance with the process set forth in the NCP [Subpart E, Section 300.400(g)]. These requirements are identified in the RI, refined and developed during the FS, limited during the stage of the CERCLA remedy selection process, and finalized in the record of decision (ROD). When identifying ARARs, CERCLA Section 121 (d) "*Degree of cleanup*" directs that any remedial action selected shall attain a degree of cleanup of hazardous substances, pollutants and contaminants released into the environment, or control of further release, that at a minimum assures the protection of human health and the environment.

Regulatory language interpreting and implementing the statutory directive within the NCP [40 CFR 300.400(g)], provides that the lead agency (USACE) and support agencies (e.g., New York State Department of Environmental Conservation [NYSDEC]) shall identify applicable requirements. These requirements shall be based on an objective determination of whether the requirement specifically addresses a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site. If it is determined that a requirement is not applicable to a specific release, the requirement may still be relevant and appropriate to the circumstances of the release. As will be discussed below, that determination is made in accordance with 40 CFR 300.400(g)(2). Under 40 CFR 300.430(e), USACE has the

ultimate responsibility to identify what requirements are ARARs for potential remedial alternatives.

The general process to develop ARARs for the Guterl Site begins with a review of the specific language used to describe the concept of ARARs in Section 121(d) of CERCLA and the NCP provisions in 40 CFR § 300.5. To be considered an ARAR, a requirement must consist of a "standard, requirement, criteria, or limitation" that has been formally promulgated as a statute or regulation under a federal environmental law, or a state environmental or facility siting law [CERCLA § 121(d)(2)(A)]. Thus, non-promulgated requirements are not ARARs. In addition, Section 121(d)(2)(A) of CERCLA states that ARARs apply "with respect to any hazardous substance, pollutant or contaminant that will remain onsite." Regulations that relate to activities associated with the implementation of a remedial action, such as U, S. Department of Transportation requirements governing the shipment of radioactive waste and Occupational Safety and Health Act requirements that address worker health and safety are considered technical requirements that would be complied with during execution of the remedial action but are not related to the degree of cleanup and therefore not ARARs.

Only the substantive requirements within a regulation can be considered an ARAR; administrative and procedural requirements do not qualify. In accordance with the NCP, disposal actions need to comply only with *substantive* requirements (55 *FR* 8758, March 8, 1990). Examples of administrative/procedural requirements include administrative approvals, inspections, permits, consultations, definitions, and reporting requirements. Administrative/procedural requirements also include methodologies or procedures applicable only to the regulatory agency.

The next step in identifying ARARs is to determine whether a requirement is legally applicable. Applicable requirements are those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site. Only those state standards identified in a timely manner and that are more stringent than federal requirements may be applicable [CERCLA (§ 121(d)) and NCP (40 CFR 300.5)]. A requirement is applicable if all of the jurisdictional prerequisites of the law or rule are satisfied. These jurisdictional prerequisites are:

- Specified by the statute or regulation and subject to the authority of such statute or regulation.
- The types of substances or activities listed as falling under the authority of the statute or regulation.
- The time period for which the statute or regulation is in effect.
- The type of activities the statute or regulation requires, limits, or prohibits.

If it is determined that a requirement is not legally applicable to a specific release, the requirement may instead be relevant and appropriate to the circumstances of the release. Determining whether a rule is relevant and appropriate is a two-step process that involves determining whether the rule is relevant, and, if so, whether it is also appropriate. A requirement

is relevant if it addresses problems or situations sufficiently similar to the circumstances of the remedial action contemplated. It is appropriate if its use is well suited to the site.

In evaluating relevance and appropriateness, the factors listed below [from 40 CFR 300.400(g)(2)] are examined, where pertinent, to determine whether a requirement addresses problems or situations sufficiently similar to the circumstances of the release or remedial action contemplated, and whether its use is well suited to the site, and therefore is both relevant and appropriate.

(i) The purpose of the requirement and the purpose of the CERCLA action.
(ii) The medium regulated or affected by the requirement and the medium contaminated or affected at the CERCLA site.
(iii) The substances regulated by the requirement and the substances found at the CERCLA site.
(iv) The actions or activities regulated by the requirement and the remedial action contemplated at the CERCLA site.
(v) Any variances, waivers, or exemptions of the requirement and their availability for the circumstances at the CERCLA site.
(vi) The type of place regulated and the type of place affected by the release or action.
(vii) The type and size of structure or facility regulated and the type and size of structure or facility affected by the release or contemplated by the CERCLA action.
(viii) Any consideration of use or potential use of affected resources in the requirement and the use or potential use of the affected resource at the CERCLA site.

A determination of relevance and appropriateness may be applied to only portions of a requirement, so that only parts of a requirement need be met for compliance, whereas a determination of applicability is made for the requirement as a whole, so that the entire requirement must be met for compliance.

In addition to ARARs, USACE and support agencies may identify other advisories, criteria, or guidance to be considered (TBC) for a particular release. The TBC category consists of advisories, criteria, or guidance that were developed by the U.S. EPA, other federal agencies, or states that may be useful in developing CERCLA remedies. The TBCs will be considered as guidance or justification for a standard used in the remediation if no other standard is available for a situation to help determine the necessary level of cleanup for protection of health or the environment. This may occur if no ARAR is available for a particular constituent of concern, or if there are multiple constituents of concern and/or pathways not considered when establishing the standards in the ARAR.

3.0 EVALUATION OF APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

The regulations presented in this section are Title 10 of the CFR, Part 20, Subpart E and 40 CFR 141, which have been inserted directly from the published regulations and have not been altered in any way. These regulation were evaluated in detail to determine if they are applicable or

relevant and appropriate requirements that address COCs in soil, on building surfaces, and in groundwater at the Guterl Site.

The regulations, and their specific sections, identified as ARARs for the Guterl Site include:

- 10 CFR 20, Subpart E: Standards for Protection Against Radiation; Radiological Criteria for License Termination
  - 10 CFR 20.1402: Radiological Criteria for Unrestricted Use

- 40 CFR 141, Subpart G: National Primary Drinking Water Regulations; Maximum Contaminant Levels (MCLs) and Maximum Residual Disinfectant Levels
  - 40 CFR 141.66(e): Maximum Contaminant Levels (MCLs) for Radionuclides; MCL for Uranium

3.1 10 CFR 20, Subpart E– Radiological Criteria for License Termination

10 CFR 20, Subpart E is applicable to Nuclear Regulatory Commission (NRC)-licensed facilities where NRC is the successor to the AEC for licensing of nuclear materials and facilities. 10 CFR 20, Subpart E applies to any facility licensed by the NRC to manage special nuclear, source, or byproduct radionuclide material undergoing decontamination and remediation for release of the property for reuse. The regulation was promulgated by the NRC to ensure consistent standards for determining the extent to which lands must be remediated at facilities before remediation can be considered complete, and the NRC license terminated. The Guterl Site does not have a current NRC license; therefore, this requirement is not applicable at the site but may be relevant and appropriate.

The NRC regulates byproduct, special nuclear, and source material pursuant to the authorization of the Atomic Energy Act of 1954. As an integral part of its statutory role, NRC promulgated 10 CFR 20 specifically to provide "*Standards for Protection against Radiation*." Subpart E "*Radiological Criteria for License Termination*" provides cleanup requirements for NRC licensees and serves as the primary remediation standard for non-DOE organizations in the U.S.

The criteria in this 10 CFR 20, Subpart E apply to the decommissioning of facilities licensed under Parts 30, 40, 50, 52, 60, 61, 63, 70, and 72 of 10 CFR, and release of part of a facility or site for unrestricted use in accordance with 10 CFR Section 50.83, as well as other facilities subject to the Commission's jurisdiction under the Atomic Energy Act of 1954, as amended, and the Energy Reorganization Act of 1974, as amended. For high-level and low-level waste disposal facilities (10 CFR Parts 60, 61, and 63), the criteria apply only to ancillary surface facilities that support radioactive waste disposal activities. The criteria do not apply to uranium and thorium recovery facilities already subject to Appendix A of 10 CFR Part 40, or to uranium solution extraction facilities.

Two subsections of this regulation were evaluated for relevance and appropriateness to remediation of the site:

- 10 CFR 20 Section 20.1402: Radiological Criteria for License Termination: radiological criteria under unrestricted conditions

- 10 CFR 20 Section 20.1403: Radiological Criteria for License Termination: radiological criteria under restricted conditions

A detailed relevant and appropriate analysis (i.e., evaluation against the eight factors in 40 CFR 300.400[g][2]) of CFR 20.1402 and 10 CFR 20.1403 criteria are presented in Table 1.

3.1.1 10 CFR 20, Subpart E, Section 1402: Radiological Criteria for Unrestricted Use

3.1.1.1 Published Regulation

Under 10 CFR 20.1402 of this regulation, a facility will be considered acceptable for unrestricted use if:

> *… the residual radioactivity that is distinguishable from background radiation results in a TEDE to an average member of the critical group that does not exceed 25 mrem (0.25 mSv) per year, including that from groundwater sources of drinking water, and the residual radioactivity has been reduced to levels that are as low as reasonably achievable (ALARA). Determination of the levels which are ALARA must take into account consideration of any detriments, such as deaths from transportation accidents, expected to potentially result from decontamination and waste disposal.*

The critical group is defined in 10 CFR 20.1003 as "the group of individuals reasonably expected to receive the greatest exposure to residual radioactivity for any applicable set of circumstances." The critical group has been defined as a construction worker for the Guterl Site.

3.1.1.2 Evaluation and Conclusion

The subsection of this regulation is not applicable to the Guterl Site because the site was not licensed by the NRC.

10 CFR 20.1402 establishes radiation dose limits to an average member of the critical group for all radionuclides from all possible pathways of exposure that would be acceptable for unrestricted use. These standards are relevant and appropriate to the COCs (thorium and uranium) and contaminated media (soil, building surfaces, and groundwater) being addressed at the Guterl Site. The dose limits are also relevant and appropriate for remedial alternatives being proposed in this FS.

3.1.2 10 CFR 20, Subpart E, Section 1403: Radiological Criteria for Restricted Use

3.1.2.1 Published Regulation

Substantive portions of 10 CFR 20.1403 of this regulation state that a facility will be considered acceptable for license termination under restricted conditions if:

> *(a) The licensee can demonstrate that further reductions in residual radioactivity necessary to comply with the provisions of § 20.1402 would result in net human or environmental harm or were not being made because the residual levels associated with restricted conditions are ALARA. Determination of the levels which are*

ALARA must take into account consideration of any detriments, such as traffic accidents, expected to potentially result from decontamination and waste disposal;

(b) The licensee has made provisions for legally enforceable institutional controls that provide reasonable assurance that the TEDE from residual radioactivity distinguishable from background to the average member of the critical group will not exceed 25 mrem (0.25 mSv) per year;" and

" (e) Residual radioactivity at the site has been reduced so that if the institutional controls were no longer in effect, there is reasonable assurance that the TEDE from residual radioactivity distinguishable from background to the average member of the critical group is as low as reasonably achievable and would not exceed either--

(1) 100 mrem (1 mSv) per year…

An alternative criterion is acceptable if it is protective of public health and the environment and the dose from all man-made sources combined, except medical, would be no more than 100 mrem per year. The alternative criterion also must include land use controls and achieve ALARA levels.

3.1.2.2 Evaluation and Conclusion

The subsection of this regulation is not applicable to the Guterl Site because the site was not licensed by the NRC.

10 CFR 20.1403 establishes radiation dose limits to an average member of the critical group for all radionuclides from all possible pathways of exposure that would be acceptable for restricted use. These standards are relevant and appropriate to the COCs and contaminated media being addressed at the Guterl Site. However, they are not relevant and appropriate for remedial alternatives being proposed in this FS, since all remedial alternatives (with the exception of Alternative 1—No Action) will ultimately achieve dose limits for unrestricted use by a construction worker. In other words, there are no restricted use alternatives for a construction worker being proposed for the Guterl Site in this FS.

3.2 40 CFR 141, Subpart G, Section 66 (40 CFR 141.66(e)): National Primary Drinking Water Standards; MCLs for Radionuclides; MCL for Uranium

3.2.1.1 Published Regulation

"MCL for uranium. The maximum contaminant level for uranium is 30 μg/L."

3.2.1.2 Evaluation and Conclusion

The national primary drinking water regulations apply to "*public water systems*." A "public water system" is defined in 40 CFR 141.2 as:

…a system for the provision to the public of water for human consumption through pipes or, after August 5, 1998, other constructed conveyances, <u>if such</u>

system has at least fifteen service connections or regularly serves an average of at least twenty-five individuals daily at least 60 days out of the year.

As discussed in Section 2.1.8 of this FS, surface water in the adjacent Erie Canal has served (on an emergency basis by the City of Lockport) as a drinking water source. This emergency intake in the Erie Canal does have at least 15 service connections. Therefore, surface water in the Erie Canal, adjacent to the Guterl Site may be considered a public water system.

A "public water system" is either a "community water system" or "non-community water system." As defined in 40 CFR 141.2:

A "community water system means a public water system which serves at least 15 service connections used by year-round residents or regularly serves at least 25 year-round residents."

A "non-community water system means a public water system that is not a community water system."

Although surface water in the Erie Canal, adjacent to the Guterl Site, does service at least 15 connections, it is only used on an emergency basis by the City of Lockport and not year-round by local residents. Therefore, surface water in the Erie Canal may be considered a "non-community public water system".

A non-community water system is either a "transient non-community water system (TWS)" or a "non-transient non-community water system (NTNCWS)." As defined in 40 CFR 141.2:

A "transient non-community water system or TWS means a non-community water system that does not regularly serve at least 25 of the same persons over six months per year."

A "non-transient non-community water system or NTNCWS means a public water system that is not a community water system and that regularly serves at least 25 of the same persons over 6 months per year."

Surface water in the Erie Canal is only used for drinking water purposes on an emergency basis (i.e., does not regularly serve at least 25 of the same persons over six months per year). Therefore, surface water in the Erie Canal may be considered a "transient non-community public water system."

Although groundwater underlying the Guterl Site intermittently discharges (via seeps) to surface waters of the adjacent Erie Canal, a worst-case mass balance calculation of uranium in groundwater (Appendix D) indicates that uranium in groundwater underlying the Guterl Site will not cause an uranium MCL exceedance in surface waters of the Erie Canal at any time between present and the next 1,000 years. Therefore, surface water is not a media of concern at the Guterl Site and the national primary drinking water regulations are not considered an ARAR for surface water in the Erie Canal for the protection of this transient, non-community public water system.

Groundwater underlying the Guterl Site is of sufficient quality and quantity to be considered potable for drinking water purposes. Since no functioning groundwater wells were identified within a half-mile radius of the Guterl Site (Appendix C) and groundwater at and near the site does not meet the criteria of a public water system (as defined above), the national primary drinking water regulation is not applicable to groundwater at the Guterl Site.

Since uranium is the FUSRAP-related COC in groundwater at the Guterl Site and the national primary drinking water regulation contains substantive criteria (i.e. MCL) pertaining to the hazardous substance, pollutant, or contaminant (i.e., uranium), the MCL is relevant and appropriate to groundwater underlying the Guterl Site.

4.0 REGULATIONS EVALUATED BUT DETERMINED NOT TO BE APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

A general discussion of several other regulations that did not meet the criteria to qualify as ARARs, summarized below, is presented in Subsections 4.1 through 4.15.

- 10 CFR 40: Domestic Licensing of Source Material
- 40 CFR 192, Subparts A and B: Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings
- 40 CFR 61: National Emissions Standards for Hazardous Air Pollutants
    - Subpart H: National Emission Standards for Emissions of Radionuclides other than Radon from Department of Energy Facilities;
    - Subpart I: National Emission Standards for Radionuclide Emissions from Federal Facilities other than NRC Licensees and Not Covered by Subpart H; and
    - Subpart Q: National Emission Standards for Radon from Department of Energy Facilities.
- 40 CFR 191, Subparts A, B, and C: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level, and Transuranic Wastes.
- 10 CFR 61: Licensing Requirements for Land Disposal of Radioactive Waste
- 6 NYCRR Part 360: Solid Waste Management Facility Regulations
- 6 NYCRR Part 370: Hazardous waste Management System: General
- 6 NYCRR Part 371: Identification and Listing of Hazardous Waste
- 6 NYCRR Part 372: Hazardous Waste Manifest System and Related Standards for Generators, Transporters, and Facilities
- 6 NYCRR Subpart 373-1: Hazardous Waste Treatment, Storage, and Disposal Facility Permitting Requirements
- 6 NYCRR Subpart 373-2: Final Status Standards for Owners and Operators of Hazardous Waste Facilities
- 6 NYCRR Subpart 373-3: Interim Status Standards for Owners and Operators of Hazardous Waste Facilities
- 6 NYCRR Part 375: Inactive Hazardous Waste Disposal Site Remedial Program
- 6 NYCRR Part 376: Land Disposal Restrictions

- 6 NYCRR Part 380: Prevention and Control of Environmental Pollution by Radioactive Materials

4.1 10 CFR 40: Domestic Licensing of Source Material

The regulations in this part establish procedures and criteria for the issuance of licenses to receive title to, receive, possess, use, transfer, or deliver source and byproduct materials, as defined in this part, and establish and provide for the terms and conditions upon which the NRC will issue such licenses. These regulations also provide for the disposal of byproduct material and for the long-term care and custody of byproduct material and residual radioactive material.

The specific purpose of 10 CFR 40 Appendix A (Criteria Relating to the Operation of Uranium Mills and the Disposition of Tailings or Waste Produced by the Extraction or Concentration of Source Material from Ores Processed Primarily for Their Source Material Content) is to provide standards for long-term management and disposal of 11e.(2) byproduct material or residual radioactive material, consisting of mill tailings and other waste, from active mill processing facilities or inactive facilities subject to NRC licensing requirements, in a manner that is protective of human health and the environment.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR (as that term is defined in CERCLA or the NCP) because it does not contain substantive criteria pertaining to the hazardous substances, pollutants, and contaminants, or the circumstances of their release at the site. On-site disposal has not been retained as a technology/process option for the site. However, any of the substantive requirements of the regulation that may apply to other matters (off-site activities) will be complied with during the course of the CERCLA action.

4.2 40 CFR 192, Subparts A and B: Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings

Under the Uranium Mill Tailings Radiation Control Act (UMTRCA), the U.S. EPA was directed to develop "standards of general application…for the protection of the human health, safety, and the environment from radiological and nonradiological hazards associated with (uranium mill tailings)" for both the inactive and active processing sites, 42 U.S.C. 2022 and 772 F.2d 617. These standards of general application were promulgated in 40 CFR 192.

The DOE was directed to provide for the decontamination of all inactive processing sites designated in Title I of UMTRCA, and those that may be added in accordance with UMTRCA and with U.S. EPA standards 42 U.S.C. 7918(a)(1). However, these standards are not legally applicable to the Guterl Site because the site is not among the 24 Title I Remedial Action Program sites, as defined in Section 102 (Designation of Processing Sites) of the UMTRCA, as amended (42 United States Code [USC] 88). These standards also are not applicable under UMTRCA Title II because necessary criteria are not met for them to be applicable: (1) uranium ore processing was not performed and residues are not present at the site, and (2) the site is not an NRC-licensed facility, and the DOE and USACE are not licensees.

The requirements specified in 40 CFR 192 are not considered relevant to the Guterl Site because: (1) no AEC uranium ores containing ^{226}Ra are known to have been used or processed at the Guterl Site; (2) the natural decay of the uranium and thorium metals is not likely to have generated significant quantities of ^{226}Ra or ^{222}Rn; and (3) ^{226}Ra was found not to contribute

significantly to risk or dose. Since other radionuclides are known to be present, 40 CFR 192 is not appropriate for the remedial alternatives being considered for the Guterl Site.

4.3 40 CFR 61: National Emission Standards for Hazardous Air Pollutants

The Clean Air Act (CAA) requires the U.S. EPA to develop and enforce regulations to protect the general public from exposure to airborne contaminants that are known to be hazardous to human health. National Emission Standards for Hazardous Air Pollutants (NESHAPS) are point-source standards promulgated under Title III of CAA for substances identified by U.S. EPA as hazardous air pollutants (HAPs). HAPs are designated as hazardous substances under CERCLA 101(14). The U.S. EPA promulgated NESHAPS under 40 CFR 61. The NESHAPS are intended to address air pollutants for which National Ambient Air Quality Standards do not exist, but that may cause or contribute to an increase in mortality, irreversible illness, or incapacitating but reversible illness. 40 CFR 61 applies to emissions of particular pollutants from specific stationary sources and requires the application of technology-based emissions standards referred to as Maximum Achievable Control Technology.

40 CFR 61 consists of several subparts, including the following:

- Subpart A: General Provisions
- Subpart B: National Emission Standards for Radon Emissions from Underground Uranium Mines
- Subpart C: National Emission Standard for Beryllium
- Subpart D: National Emission Standard for Beryllium Rocket Motor Firing
- Subpart E: National Emission Standard for Mercury
- Subpart F: National Emission Standards for Vinyl Chloride
- Subpart G: Reserved
- Subpart H: National Emission Standards for Emissions of Radionuclides other than Radon from Department of Energy Facilities
- Subpart I: National Emission Standards for Radionuclide Emissions from Federal Facilities other than NRC Licensees and Not Covered by Subpart H
- Subpart J: National Emission Standard for Equipment Leaks (Fugitive Emission Sources) of Benzene
- Subpart K: National Emission Standards for Radionuclide Emissions from Elemental Phosphorus Plants
- Subpart L: National Emission Standard for Benzene Emissions from Coke By-Product Recovery Plants
- Subpart M: National Emission Standard for Asbestos
- Subpart N: National Emission Standard for Inorganic Arsenic Emissions from Glass Manufacturing Plants
- Subpart O: National Emission Standard for Inorganic Arsenic Emissions from Primary Copper Smelters

- Subpart P: National Emission Standard for Inorganic Arsenic Emissions from Arsenic Trioxide and Metallic Arsenic Production Facilities
- Subpart Q: National Emission Standards for Radon Emissions From Department of Energy Facilities
- Subpart R: National Emission Standards for Radon Emissions from Phosphogypsum Stacks
- Subpart S: Reserved
- Subpart T: National Emission Standards for Radon Emissions from the Disposal of Uranium Mill Tailings
- Subpart U: Reserved
- Subpart V: National Emission Standard for Equipment Leaks (Fugitive Emission Sources)
- Subpart W: National Emission Standards for Radon Emissions from Operating Mill Tailings
- Subpart X: Reserved
- Subpart Y: National Emission Standard for Benzene Emissions from Benzene Storage Vessels
- Subparts Z and AA-Reserved
- Subpart BB: National Emission Standard for Benzene Emissions from Benzene Transfer Operations
- Subparts CC to EE-Reserved
- Subpart FF: National Emission Standard for Benzene Waste Operations

Among these subparts, Subpart H (National Emission Standards for Emissions of Radionuclides other than Radon from Department of Energy Facilities), Subpart I (National Emission Standards for Radionuclide Emissions from Federal Facilities other than NRC Licensees and Not Covered by Subpart H), Subpart Q (National Emission Standards for Radon Emissions from Department of Energy Facilities), and Subpart T (National Emission Standards for Radon Emissions from the Disposal of Uranium Mill Tailings) were evaluated as potential ARARs.

Subparts H, I and Q are not applicable since the Guterl Site is not a federally owned facility. Subpart T is not applicable since the Guterl Site is not a Title 1 UMTRCA site.

Also, these subparts are not considered relevant and appropriate as they do not address situations sufficiently similar to the circumstances of the release or remedial action and are not well suited to the site. Specifically, the Guterl Site does not and will not contain a “facility” similar in nature to those that Subparts H, I and Q regulate. Additionally Subparts H, I, W, and T regulate sites that will emit radon or something other than radon-222 or radon-220 and such emissions are not anticipated to occur on the Guterl Site.

4.4 40 CFR 191: Subparts A, B, and C: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level, and Transuranic Wastes

The U.S. EPA promulgated 40 CFR 191 as a general environmental regulation for the management and disposal of spent nuclear fuel and high-level and transuranic (TRU) waste. This regulation consists of three subparts: Subpart A, Environmental Standards for Management and Storage; Subpart B, Environmental Standards for Disposal; and Subpart C, Environmental Standards for Groundwater Protection.

The requirements in 40 CFR 191.01 (Subpart A), 40 CFR 191.11 (Subpart B), and 40 CFR 191.21 (Subpart C) define "applicability" for their respective subparts and, therefore, are generally administrative/procedural in nature; however, they are useful in determining the applicability of the regulation to the Guterl Site. These requirements specify that 40 CFR 191 applies to radiation doses or releases of radioactive materials resulting from the management (except for transportation) and storage of spent nuclear fuel, high-level, or TRU radioactive waste at NRC and DOE facilities. Because they apply to "spent nuclear fuel, high-level, or TRU radioactive waste," the requirements of 40 CFR 191 are not applicable to the milling operations that were performed at the Guterl Site. The contaminated soils and building surfaces at the Guterl Site are not spent nuclear fuel and are not comprised of the radionuclides, which make up high-level waste or TRU waste. In addition, the site is not regulated by the NRC or an agreement state (New York) and is not currently operated by DOE. Therefore, the substantive criteria developed for high-level waste, TRU waste, and spent fuel under 40 CFR 191, are not applicable to the contaminated media at the site.

4.5 10 CFR 61: Licensing Requirements for Land Disposal of Radioactive Waste

The NRC regulates byproduct, special nuclear, and source material pursuant to the authorization of the Atomic Energy Act of 1954. As an integral part of its statutory role, NRC has promulgated 10 CFR 61 specifically to provide "Licensing Requirements for Land Disposal of Radioactive Waste."

As stated in 10 CFR 61.1, this regulation establishes (for land disposal of radioactive waste) the procedures, criteria, and terms and conditions upon which the NRC issues licenses for the disposal of radioactive waste containing byproduct, source, and special nuclear material received from *other persons* (i.e., licensed or un-licensed facilities). Low-level radioactive waste is radioactive waste not classified as high-level radioactive waste, transuranic (TRU) waste, spent nuclear fuel, or byproduct material, as defined in Section 11e.(2) of the Atomic Energy Act (uranium or thorium tailings and waste).

This regulation is not considered to be relevant and appropriate for the Guterl Site since no remedial alternative being proposed includes on-site disposal.

4.6 6 NYCRR 360: Solid Waste Management Facility Regulations

The regulations in 6 NYCRR 360 regulate solid waste management facilities located partially or wholly within the New York State. This regulation applies to all solid waste other than low-level radioactive waste and naturally-occurring and accelerator-produced radioactive materials waste, and disposal activities involving those wastes.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. However, any substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.7 6 NYCRR Part 370: Hazardous Waste Management System: General

The regulations in 6 NYCRR 370 provide definitions of terms and general standards applicable to Parts 370 through 374, and 376. The regulation also sets forth the regulations that the department will use in making information it receives available to the public and sets forth the requirements that generators; transporters; or owners or operators of treatment, storage, or disposal facilities must follow to assert claims of business confidentiality with respect to information that is submitted to the department under Parts 370 through 374 and 376.

After reviewing the contents of the regulation USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead, the regulation pertains to hazardous waste. Constituents of concern related to FUSRAP are not hazardous waste. However, any of the substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.8 6 NYCRR Part 371: Identification and Listing of Hazardous Wastes

The regulations in 6 NYCRR 371 establish the procedures for identifying those solid wastes which are subject to regulation as hazardous wastes under Parts 370 through 373, and 376. However, even though a given material is defined as a hazardous waste under this part, it may be exempt from one or more of the substantive provisions of those parts, as specified in each respectively.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead, the regulation pertains to hazardous waste. The FUSRAP-related COCs are not hazardous waste. However, any of the substantive requirements of the regulation that may apply will be complied with during the course of the CERCLA action.

4.9 6 NYCRR Part 372: Hazardous Waste Manifest System and Related Standards for Generators, Transporters, and Facilities

The regulations in 6 NYCRR 372 establish standards for generators and transporters of hazardous waste and standards for generators, transporters, and treatment, storage or disposal facilities relating to the use of the manifest system and its record keeping requirements. The manifest document shall accompany all shipments of hazardous waste while in transit unless specifically exempted under this part. The manifest document will serve as a multipurpose instrument to be used as a tracking, auditing, and enforcement device.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. However, any of the substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.10 6 NYCRR Subpart 373-1: Hazardous Waste Treatment, Storage, and Disposal Facility Permitting Requirements

The regulations in 6 NYCRR 373-1 regulate hazardous waste management facilities located partially or wholly within New York State.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead it is procedural in nature. However, any of the substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.11 6 NYCRR Subpart 373-2: Final Status Standards for Owners and Operators of Hazardous Waste Treatment Storage and Disposal Facilities

The regulations in 6 NYCRR 373-2 establish minimum state standards which define the acceptable management of hazardous waste. The standards in this subpart apply to owners and operators of all facilities which treat, store, or dispose of hazardous waste, except as specifically provided otherwise in this part or Part 371.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. However, any of the substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.12 6 NYCRR Subpart 373-3: Interim Status Standards for Owners and Operators of Hazardous Waste Facilities

The regulations in 6 NYCRR 373-3 establish minimum statewide standards that define the acceptable management of hazardous waste during the period of interim status and until certification of final closure or, if the facility is subject to post-closure requirements, until post-closure responsibilities are fulfilled.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead, the regulation pertains to hazardous waste. FUSRAP-related COCs are not hazardous waste. However, any of the substantive

requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.13 6 NYCRR Part 375: Inactive Hazardous Waste Disposal Site Remedial Program

The regulations in 6 NYCRR 375 establish the development and implementation of remedial programs for inactive hazardous waste disposal sites, specifically under Subpart 375-2, including, but not limited to, sites listed in the registry which are either on the national priorities list (NPL) or are being addressed by the Department of Defense or the Department of Energy.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead, the regulation pertains to hazardous waste. The FUSRAP-related COCs are not hazardous waste. However, any of the substantive requirements of the regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.14 6 NYCRR Part 376: Land Disposal Restrictions

The regulations in 6 NYCRR 376 identify hazardous wastes that are restricted from land disposal and define those limited circumstances under which an otherwise prohibited waste may be land disposed. Except as specifically provided otherwise in this part or Part 371, the requirements of this part apply to persons who generate or transport hazardous waste and owners and operators of hazardous waste treatment, storage, and disposal facilities.

Since there are no remedial alternatives where the material is capped in place, there will be no generation and placement of hazardous wastes so land disposal restrictions would not be applicable. Under alternatives that include excavation and off-site disposal, land disposal restrictions would not pertain to the on-site actions. It will be the responsibility of the off-site disposal facility to satisfy land disposal restrictions if they are applicable to the waste sent to them. Only under an alternative where the hazardous waste is generated (e.g., by excavation), and then placed into an on-site land disposal unit, would land disposal restrictions be considered potential ARARs.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances or pollutants and contaminants or the circumstances of their release at the site. Instead it is procedural in nature. However, any of the substantive requirements of regulation that may apply to other matters will be complied with during the course of the CERCLA action.

4.15 6 NYCRR 380: Prevention and Control of Environmental Pollution by Radioactive Materials

The regulations in 6 NYCRR 380 establish standards to protect against ionizing radiation resulting from the disposal and discharge of radioactive material to the environment. The purpose of the requirements in this regulation is to control the disposal and discharge of radioactive material to the environment so that the total dose to an individual member of the

public (including doses resulting from licensed and unlicensed radioactive material and from radiation sources other than background radiation) does not exceed the standards for protection against radiation prescribed in Subpart 380-5.

After reviewing the contents of the regulation, USACE determined it does not meet the definition of an ARAR, (as that term is defined in CERCLA or the NCP, because it does not contain substantive criteria pertaining to the hazardous substances, pollutants, and contaminants, or the circumstances of their release at the site. None of the proposed alternatives for the Guterl Site involve the disposal of material at the site.

[This page is intentionally left blank]

TABLE 1
Relevant and Appropriate Analysis for the Guterl Specialty Steel Site, Lockport, New York

	(i) The purpose of the requirement and the purpose of the CERCLA action.	(ii) The medium regulated or affected by the requirement and the medium contaminated or affected at the CERCLA site.	(iii) The substances regulated by the requirement and the substances found at the CERCLA site.	(iv) The actions or activities regulated by the requirement and the remedial action contemplated at the CERCLA site.	(v) Any variances, waivers, or exemptions of the requirement and their availability for the circumstances at the CERCLA site.	(vi) The type of place regulated and the type of place affected by the release or CERCLA action.	(vii) The type and size of structure or facility regulated and the type and size of structure or facility affected by the release or contemplated by the CERCLA action.	(viii) Any consideration of use or potential use of affected resources in the requirement and the use or potential use of the affected resource at the CERCLA site.
10 CFR 20 Subpart E - (20.1402) Radiological Criteria for License Termination: radiological criteria for unrestricted use	Criterion states a site will be considered acceptable for site closure by unlimited use/unrestricted exposure if the residual radioactivity that is distinguishable from background radiation results in a total effective dose equivalent (TEDE) to an average member of the critical group that does not exceed 25 mrem (0.25 mSv) per year, including that from groundwater sources of drinking water, and that the residual radioactivity has been reduced to levels that are as low as reasonably achievable (ALARA). Determination of the levels which are ALARA must take into account consideration of any detriments, such as deaths from transportation accidents, expected to potentially result from decontamination and waste disposal.	Addresses soil, buildings, and groundwater. Each of these media is impacted.	10 CFR 20 establishes standards for protection against ionizing radiation resulting from activities conducted under licenses issued by the Nuclear Regulatory Commission. These regulations are issued under the Atomic Energy Act of 1954, as amended, and the Energy Reorganization Act of 1974, as amended.	This subpart addresses decommissioning of facilities licensed under the Atomic Energy Act. The Former Guterl Specialty Steel Corporation was not licensed; but from 1948 to 1956, under the former ownership of Simonds, performed rolling mill operations on uranium metal and, to a much smaller extent, thorium metal.	10 CFR 20.1404 provides for alternative criteria for license termination provided that there are assurances that the public health and safety would continue to be protected; has employed to the extent practical restrictions on site use; reduces doses to ALARA levels; and has submitted a decommissioning plan indicating closure by alternative criteria. A waiver will not be requested for this site.	The regulations in this part apply to persons licensed by the Nuclear Regulatory Commission to receive, possess, use, transfer, or dispose of byproduct, source, or special nuclear material or to operate a production or utilization facility. The limits in this part do not apply to doses due to background radiation, to exposure of patients to radiation for the purpose of medical diagnosis or therapy, to exposure from individuals administered radioactive material and released under §35.75, or to exposure from voluntary participation in medical research programs. The Former Guterl Specialty Steel Corporation was not licensed; but from 1948 to 1956, under the former ownership of Simonds, performed rolling mill operations on uranium metal and, to a much smaller extent, thorium metal.	The type and size of structure or facility to be regulated under the rule is a facility licensed to receive, possess, use, transfer, or dispose of byproduct, source, or special nuclear material or to operate a production or utilization facility with wastes typically contained on-site in some manner. At closed or inactive sites, the wastes are typically transferred to a licensed disposal facility. Active facilities may contain the waste in some type of closed structure. The type of operations at the former site is similar to these actions.	This subpart is applied to a site to be considered acceptable for license termination under unrestricted conditions.

TABLE 1
Relevant and Appropriate Analysis for the Guterl Specialty Steel Site, Lockport, New York

	(i) The purpose of the requirement and the purpose of the CERCLA action.	(ii) The medium regulated or affected by the requirement and the medium contaminated or affected at the CERCLA site.	(iii) The substances regulated by the requirement and the substances found at the CERCLA site.	(iv) The actions or activities regulated by the requirement and the remedial action contemplated at the CERCLA site.	(v) Any variances, waivers, or exemptions of the requirement and their availability for the circumstances at the CERCLA site.	(vi) The type of place regulated and the type of place affected by the release or CERCLA action.	(vii) The type and size of structure or facility regulated and the type and size of structure or facility affected by the release or contemplated by the CERCLA action.	(viii) Any consideration of use or potential use of affected resources in the requirement and the use or potential use of the affected resource at the CERCLA site.
40 CFR 141.66 National Primary Drinking Water Regulations - Maximum Contaminant Levels for Radionuclides	Establishes primary drinking water maximum contaminant levels (MCLs) for radionuclides pursuant to Section 1412 of the Public Health Service Act, as amended by the Safe Drinking Water Act (Pub. L. 93-523); and related regulations applicable to public water systems. This part shall apply to each public water system.	Groundwater is of sufficient yield and quality to be considered potable.	40 CFR 141.66 regulates radionuclides in public drinking water supplies including radium, gross alpha particle activity, beta particle and photon radioactivity, tritium, strontium, and uranium. Groundwater at the site is a viable, but nonutilized, source of drinking water (i.e. not a public water system). Uranium exceeds the MCL.	Use of groundwater as a public drinking water supply is the regulated activity. Groundwater at the site is a viable, but nonutilized, source of drinking water (i.e. not a public water system). Actions under consideration at the site are to restrict the potential use of groundwater as a drinking water supply, domestic or public.	40 CFR 141.4 states that variances or exemptions from certain provisions of these regulations may be granted pursuant to Sections 1415 and 1416 of the Act and Subpart K of Part 142 of this chapter (for small system variances) by the entity with primary enforcement responsibility, except that variances or exemptions from the MCLs for total coliforms and E. coli and variances from any of the treatment technique requirements of Subpart H of this part may not be granted.	The type of site or facility regulated by 40 CFR 141 is a public water supply. Groundwater at the site is a viable, but nonutilized, source of drinking water (i.e. not a public water system).	Public water system means a system for the provision to the public of water for human consumption through pipes or, after August 5, 1998, other constructed conveyances, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year. Such term includes any collection, treatment, storage, and distribution facilities under control of the operator of such system, and used primarily in connection with such system; and any collection or pretreatment storage facilities not under such control, which are used primarily in connection with such system. Such term does not include any special irrigation district. A public water system is either a community water system or a noncommunity water system.	Groundwater at the site is a viable, but nonutilized, source of drinking water (i.e. not a public water system). However, groundwater is of sufficient yield and quality to be considered potable.

Formerly Utilized Sites Remedial Action Program—Guterl Site

Site Description

The Guterl Specialty Steel Corporation Site (Guterl Site) is located in Lockport, Niagara County, New York, approximately 20 miles northeast of Buffalo, New York. The U.S. Army Corps of Engineers is investigating the site under the Formerly Utilized Sites Remedial Action Program (FUSRAP). This program was established in 1974 to identify, investigate, and if necessary, clean up or control sites throughout the United States that were contaminated as a result of the Nation's early atomic weapons and energy programs.

The 70-acre Guterl Site (Figure 1) comprises three areas:

- The 52-acre Allegheny Technologies Incorporated (ATI) (formerly Allegheny Ludlum Corporation) property. ATI Specialty Materials operates a specialty steel manufacturing facility in the southwest portion of this property.

- The 9-acre landfill area owned by ATI. This area is in the northwest corner of the site. The landfill, which ceased operations as a waste disposal area in 1981, is a Class 2 New York State Department of Environmental Conservation Inactive Hazardous Waste Disposal Site (Site No. 932032).

- The 9-acre excised area owned by Guterl Specialty Steel. This area includes nine buildings located in the southeast corner of the site that had been used during Atomic Energy Commission (AEC) operations to roll uranium metal. These buildings are abandoned, and a chain link security fence surrounds them.

Land use near the Guterl Site is mixed. It consists of private residences, light industries, and a former railroad right-of-way. The Erie Canal is south-southeast of the site.

Purpose

The purpose of groundwater monitoring at the Guterl Site is to determine the potential for movement of FUSRAP-related radiological contaminants associated with historical AEC activities. Between 1948 and 1956, the AEC's New York Operations Office managed contracts there with Simonds Saw and Steel, a previous owner of the property, to roll uranium steel billets into rods.

The Corps of Engineers samples a subset of the on-site groundwater wells annually to (1) monitor conditions at the site, (2) develop baseline data for monitoring groundwater in the event that an alternative is chosen that includes natural attenuation, and (3) develop and evaluate alternatives to address unacceptable risks. The Corps of Engineers posts annual environmental monitoring data reports for the Guterl Site under the "Environmental Monitoring" section of the project website (see page 3 footer for website).

Scope

The Corps of Engineers selects groundwater wells at the Guterl Site for sampling based on previously collected data and the potential for transport of FUSRAP-related constituents. The Corps sampled 51 groundwater wells in 2015; normally a subset of these wells (between 20 and 24) is sampled annually. This larger array of groundwater wells will be sampled every three to five years to verify the overall conditions of FUSRAP-related constituents in groundwater underlying the Guterl Site. Figure 1 shows the existing wells at the site and highlights the 24 shallow and deep groundwater wells sampled in 2016. A contracted laboratory analyzed the samples for dissolved uranium, the most mobile FUSRAP-related constituent at the Guterl Site.

The Corps of Engineers typically samples groundwater seeps discharging from the northern wall of the Erie Canal and surface water in the Erie Canal. However, due to regional drought conditions in 2016, there were no visible groundwater seeps to sample. Without this groundwater discharge to the canal, the Corps determined that Erie Canal water would not be measurably influenced that year, so surface water samples were not collected in 2016. Historical seep and surface water sample results, collected between 2011 and 2015, can be found in the *2015 Environmental Monitoring Report*.

Results and Interpretation

<u>Groundwater Results</u>

Table 1 presents the unfiltered and filtered analytical results for isotopic and total uranium in groundwater samples collected at the site between 2007 and 2016. The groundwater sample results are consistent with historical (i.e. 2007 and 2009–2015) data as shown in Table 1. Uranium in shallow groundwater continues to extend in the direction of groundwater flow, from the northwest to the southeast towards the Erie Canal (Figure 2). Uranium in deep groundwater is not as extensive as it is in the shallow groundwater plume; however, it extends in the same northwest to southeast

direction (Figure 3). Figure 4 presents filtered total uranium results in groundwater wells sampled in 2016, arranged in the direction of groundwater flow across the site. Groundwater monitoring well MW-605D is at the center of the Guterl Site; it continues to exhibit the highest total uranium concentration (271 µg/L, unfiltered) in groundwater.

For the 2015 sampling event, the results for the paired shallow well MW-602D and deep well MW-702DD were an anomaly. The result for each well contradicted previous concentration levels. This led the Corps to review lab reports and sample collection logs to determine if there had been an error in the sample collection and/or laboratory processing analysis, yet no error was apparent. The 2016 sampling event supports that 2015 was an anomaly since the 2016 sampling results from these wells were consistent with historical results before 2015.

Conclusions

Uranium concentrations in groundwater at the Guterl Site are consistent overall with historical results. There is a seasonal fluctuation in the size of the groundwater plume. Depending on what time of the year the sampling occurs, the uranium concentration results vary due to the amount of groundwater present within the site. Groundwater under the site is currently not a utilized source of potable (i.e. drinking) water; therefore, there is no risk to human health above acceptable levels.

Next Steps

The U.S. Army Corps of Engineers will continue to sample groundwater, seeps, and surface water to monitor conditions and support the development of the feasibility study and proposed plan for the Guterl Site. The next round of groundwater, seeps, and surface water sampling will occur in the fall of 2017.

Notes:

- Analysis for uranium, Method ASTM D5174 Modified.
- Analysis for isotopic uranium, Method EML U-02 Modified.
- The shaded rows identify 2016 data.
- The 2016 sampling event supports that an anomaly did occur in 2015 for shallow well MW-602D and deep well MW-702DD. The 2016 data is consistent with historical data before 2015.

pCi/L: Picocuries per liter
µg/L: micrograms per liter
U: Nondetect (Results are below the Minimum Detectable Activity/Minimum Detectable Concentration.)
J: Estimated
