

1 August 2002

MEMORANDUM FOR RECORD

**SUBJECT: DETERMINATION OF THE SUITABILITY OF DREDGED MATERIAL TESTED UNDER DMMP EVALUATION PROCEDURES FOR THE US COAST GUARD PIER 36 DREDGING PROJECT (2002- 2-00859, DAIS # CGP36-1-B-F-172) WITH PROPOSED DISPOSAL AT THE ELLIOTT BAY OPEN WATER DISPOSAL SITE.**

1. The US Coast Guard proposes to dredge 23,200 cubic yards of material from its Alpha Berth at Pier 36, Seattle Washington. The following summary reflects the DMMP agencies (Corps of Engineers, Department of Ecology, Department of Natural Resources and the Environmental Protection Agency) consensus decision on the acceptability of the sampling plan and all relevant test data to make a determination of suitability for the disposal of the material at a PSDDA open-water disposal site.
2. The ranking for this area is "high" based on the guidance found in the PSDDA User's Manual (2000) and the PSDDA Management Plan Report, Phase II, Page A-11 (1989).
3. A sampling and analysis plan was completed for this project and approved by the DMMP agencies on 27 February 2001. Sampling for this project was performed on 15-19 March 2001. All sampling was performed in accordance with the approved sampling plan, with the exception that boring locations B-1 and B-2 were moved due to Pier damage caused by the February 2001 Nisqually earthquake. Boring relocation was approved by the DMMP prior to sampling.

*SAP Submittal date*

SAP approval date 27 February 2001

Sampling date 15-19 March 2001

Data Report submittal date December 2001

Recency determination dates 15 March 2003

4. Samples were taken at four locations. Two samples were composited for each analysis for two surface DMMUs (1, 2) and four subsurface DMMUs (3, 4, 5, 6). The sampling and compositing plan and sampling depths are reported in Table 1.
5. All DMMU had exceedances of 2001 DMMP screening levels for the standard list of chemicals of concern. DMMU 1 had exceedances of the DMMP maximum level for

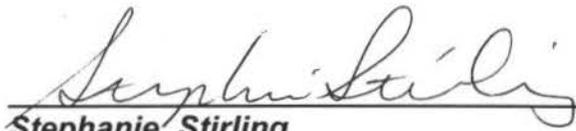

mercury, pyrene, benzo(a)pyrene, and total DDT. DMMU 2 had ML exceedances for acenaphthene, pyrene, benzo(a)anthracene, pyrene, and benzo(a)pyrene. Screening level, bioaccumulation trigger and maximum level exceedances are detailed in Table 2. DMMU 3 exceeded the ML for ethylbenzene and total xylene.

6. DMMU 1 and 2 were analyzed for porewater tributyltin. Both exceeded the screening level, triggering the requirement for bioaccumulation testing.
7. Due to multiple maximum level and bioaccumulation trigger exceedances, the Coast Guard chose not to pursue bioassay testing on DMMUs 1, 2 and 3. Bioassays were conducted on DMMUs 4, 5, and 6, including the amphipod 10-day acute toxicity test, using *Rhepoxinius abronius*, the sediment larval test, using *Dendraster excentricus*, and the *Neanthes* 20-day growth test. Tests were conducted according to PSEP (1995), as modified by the DMMP program.
8. Reference sediment for use in the bioassays was collected from Carr Inlet. Control sediment for the amphipod test was obtained from West Beach. Amphipod organisms were obtained from West Beach. *Dendraster* organisms were obtained from M-Rep in Carlsbad CA. *Neanthes* organisms were obtained from Dr. Don Reish, Long Beach California.
9. Bioassay results are listed in Table 3. No hits were observed in the bioassays, and all bioassays generally met performance standards. The sediment larval test did not have a seawater control run in conjunction with the bioassay. The DMMP agencies agreed that using the initial count (in effect, a control mortality of zero) would be a conservative interpretation of the test results.
10. In summary, the DMMP-approved sampling and analysis plan was followed, and quality assurance, quality control guidelines specified by the DMMP were generally followed. The data gathered were deemed sufficient and acceptable for regulatory decision-making under the DMMP program. Based on the results of the chemical and biological testing, the consensus determination of the DMMP agencies is that approximately 10,400 cubic yards of material is not suitable for in-water disposal. Approximately 12,800 cubic yards from the Coast Guard Pier 36 project is suitable for disposal at the Elliott Bay open-water disposal site.
11. This memorandum documents the suitability of proposed dredged sediments for disposal at a PSDDA open water disposal site. It does not constitute final agency approval of the project. A dredging plan for this project must be completed as part of the final project approval process, including both vertical and horizontal buffers for the unsuitable material. A final decision will be made after full consideration of agency and public input, and after an alternatives analysis is done under section 404 (b) 1 of the Clean Water Act.

| <b>C5</b>  | 6  | 29.00   | <b>0.68</b><br>mortality = 16%                                       | yes              | yes |
| <b>C6</b>  | 4  | 32.99   | <b>0.53</b><br>mortality = 4%  | yes              | yes |
| Positive Control (LC50/EC50) TEST<br><b>DAIS (Mean ± SD)</b> | CdCl <sub>2</sub> (mg/L)<br>0.67<br><br>(0.79 ± 0.48 DAIS) | CdCl <sub>2</sub> (mg/L)<br>12.15<br><br>(10.1 ± 6.5 DAIS for <i>Dendraster</i> ) | CdCl <sub>2</sub> (mg/L)<br>9.9<br><br>(12.5 ± 5.4 DAIS)             |                  |     |

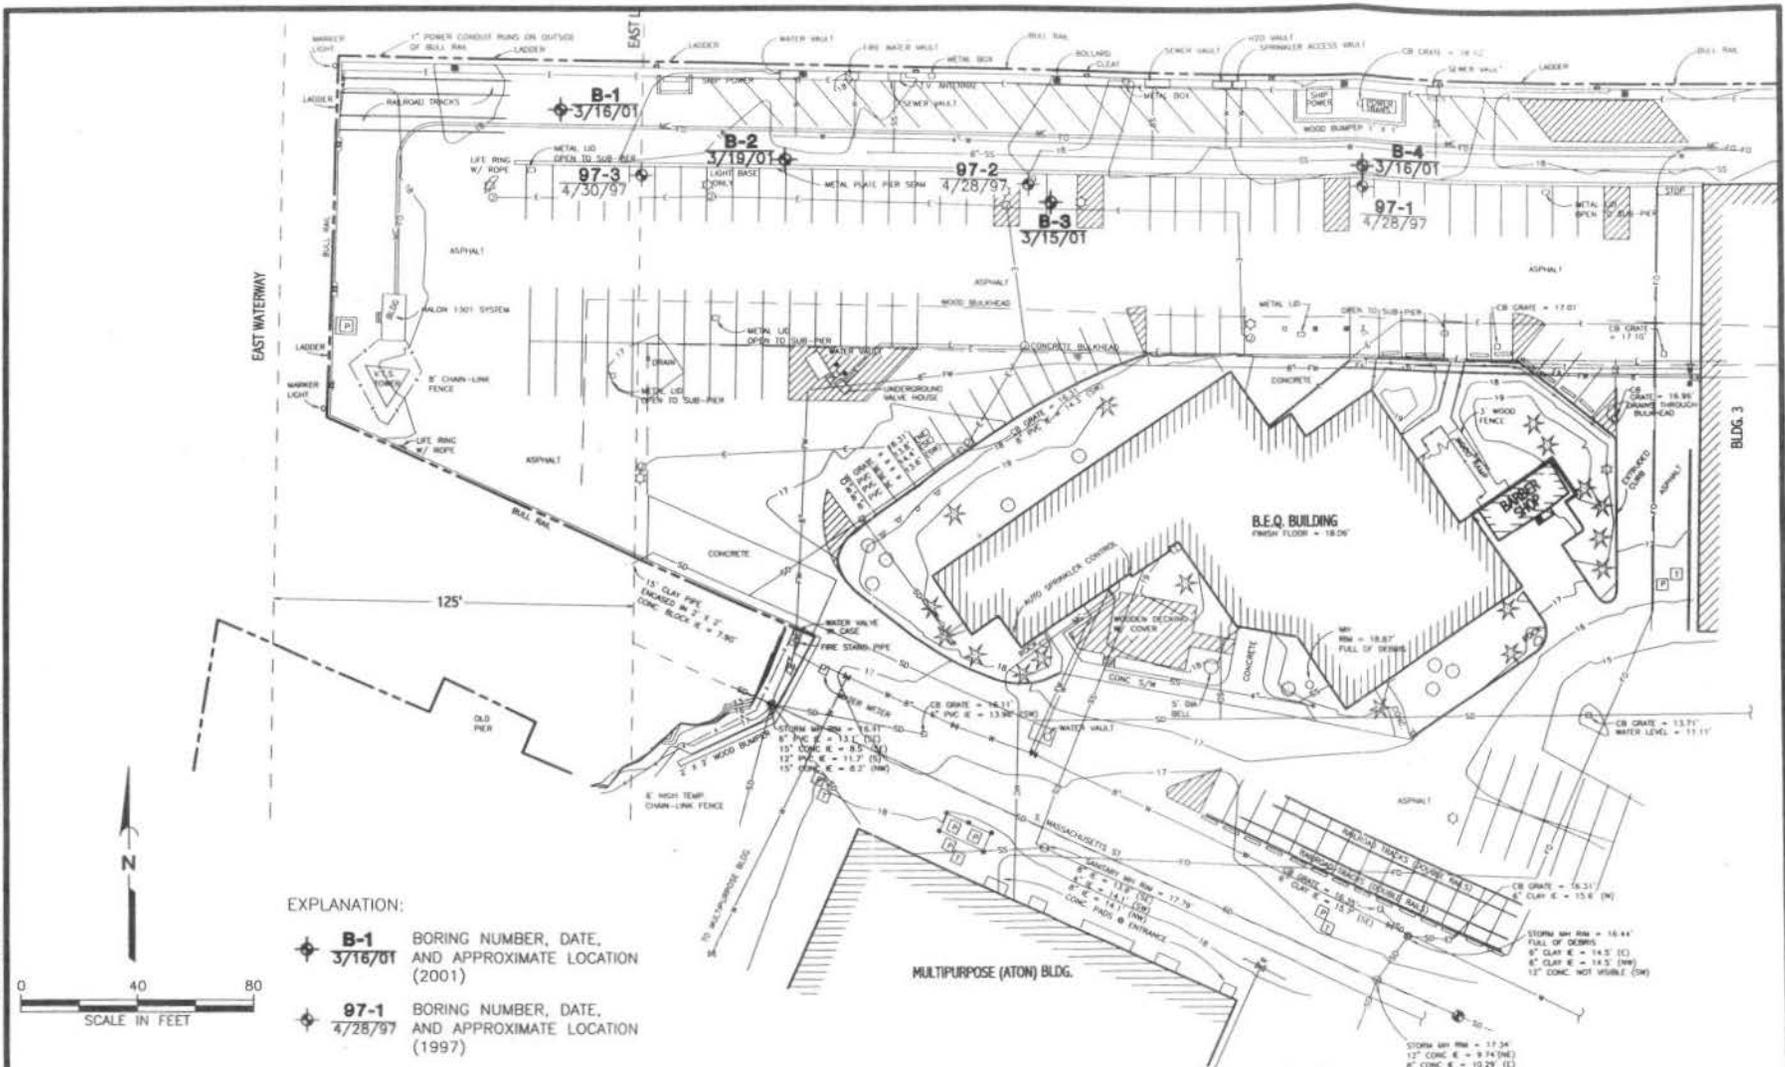

<sup>1</sup> A seawater control was not run with this bioassay. The DMMP agencies agreed to use the initial counts. All of the test values were normalized to the initial counts (in effect, a control mortality of zero) for decision-making.
